## CH 222 Chapter Ten Study Guide

- Be able to explain the <u>Kinetic Molecular Theory</u> (KMT) when describing the differences between <u>solids</u>, <u>liquids</u> and <u>gases</u>.
- Know the different <u>intermolecular forces</u> (dipole-dipole, induced dipole-induced dipole, etc.) in liquids and solids. Know their relative magnitudes which one is strongest, which is weakest, etc.
- Be able to describe the major intermolecular forces acting upon a molecule or atom or a group of molecules or atoms.
- Know the requirements for <u>hydrogen bonding</u> a hydrogen atom bonded to oxygen, nitrogen or fluorine.
- Be able to explain the process of <u>evaporation</u> and <u>condensation</u> of a liquid or its vapor.
- Be able to use the <u>enthalpy of vaporization</u> and <u>enthalpy of fusion</u> in calculations.
- Define and use the concept of the <u>equilibrium vapor pressure</u> of a liquid and its relation to the <u>boiling point</u> of a liquid. Know what is meant by <u>normal boiling point</u>.
- Know how to utilize the following concepts: <u>cohesive forces</u>, <u>adhesive forces</u>, <u>surface</u> <u>tension</u>, and <u>viscosity</u>.
- Be able to characterize different types of solids: <u>metallic</u>, <u>ionic</u>, <u>molecular</u>, <u>network</u> and <u>amorphous</u>.
- Be able to describe the three types of cubic units cells: <u>simple cubic</u> (or <u>primitive</u>), <u>body centered cubic</u> and <u>face-centered cubic</u>.
- Be able to identify the different points and regions of a <u>phase diagram</u>.
- Be able to solve and understand the assigned problems in problem set #4.
