## The Chemistry 223 Companion

# Lab Manual, Problem Sets, Lecture Slides and Learning Resources 

Dr. Michael A. Russell
Mt. Hood Community College
Spring 2024

## Welcome to Chemistry 223!

My name is Dr. Michael Russell and I am pleased that you have decided to take Chemistry 223 with me this quarter. I look forward to an exciting term with you!

Here are some hints on how to get the most out of the Chemistry 223 Companion:

- Glance over the Table of Contents that follows this introduction. The Table of Contents lists the respective page numbers for each of the sections.
- If you need it: information on how to construct a graph can be found in the lab section (with a Roman number " $\boldsymbol{P}$ " leading.) A handy pictorial guide to common glassware, a ScienceNotes.org Periodic Table and a parts per thousand handout follow shortly afterwards. The labs we will be performing this quarter follow, and be sure to use the correct lab for your lab section (section W1 (online) is different from sections 01 and H 1 (face to face).)
- The problem sets and Exam Prep worksheets that we will use this quarter follow the lab section. They are listed with a Roman number "II".
- A printed version of the Lecture slides that will be covered this quarter can be found next. The PowerPoint notes use a Roman number "III" followed by the Chapter number, then the page number. For example, Page III-5-3 would refer to a PowerPoint note (the "III") in Chapter 5 (the " $\mathbf{5}$ "), and the " 3 " refers to the third page of notes for Chapter 5.
- Lecture handouts follow the lecture slides and augment difficult concepts discussed in lecture. The numbering system is similar to the PowerPoint slides system but with a "IV". For example, Page $\boldsymbol{I V} \boldsymbol{V} \mathbf{5 - 1}$ would refer to a Lecture Handout (the " $\boldsymbol{I}$ ") in Chapter 5 (the " $\mathbf{5}$ "), and the " $\boldsymbol{I}$ " refers to the first page of lecture handouts for Chapter 5.
- Finally, the Concept Guides (which are useful worked examples relating to each of the chapters studied this quarter) might prove useful - they begin with a Roman number V. Also, practice problem sets (which include answers at the end; they begin with a Roman number VI), various quizzes with answers (which begin with a Roman number VII) and finally sample quizzes and exams (with answers, they start with a Roman number VIII) follow shortly after. Note that additional quiz and exam testing resources are available on the CH 223 website (http://mhchem.org/223/classroom/qe.htm).

If you have questions throughout the quarter, please do not hesitate to contact me using the contact information below. Good luck with your studying!

## Peace,

## Dr. Michael Russell

## Laboratory Safety \& Etiquette

Safety is of utmost importance. Work in the laboratory should be a safe experience. It will be safe, however, only if certain safety precautions are followed without exception. Safety is up to you. Everyone working in the chemistry laboratories must follow the following rules. Your instructor will discuss specific safety precautions relevant to each experiment during the pre-lab lecture. Do not hesitate to consult with your instructor if you have questions regarding any safety precautions. Failure to observe laboratory safety rules and procedures may result in injury to you or to fellow students. Students who do not follow these safety rules (including proper attire) will be asked to leave the laboratory. Repeat offenders may be dropped from the course at the discretion of the instructor.

1. Appropriate attire: Appropriate protective clothing must be worn at all times while in the laboratory. It is a good idea not to wear your best clothing to lab since many chemicals can stain, bleach or generate holes in your clothing.
a. Safety goggles approved by the chemistry department must be worn at all times, even if you are wearing prescription glasses. Contact lenses are not recommended in the lab. Various fumes may accumulate under the lenses and injure your eyes. You are responsible for bringing your own pair of safety goggles to lab each week. Students who borrow safety goggles from the instructor will have points deducted from their lab. Students who fail to wear their safety goggles will be reminded once and have points deducted. The second time a student is seen without safety goggles on during a lab period, the student will be asked to leave the laboratory.
b. Shirts must cover the entire upper torso, including the midsection and upper chest area and should be long enough to tuck inside your pants. Cotton t-shirts are fine. Tank tops, scooped neck tops, leotards, sleeveless blouses and tops made of sheer material are not allowed.
c. Pants and skirts must be at least knee length. Shoes must be flat-soled and cover the entire foot. Socks must be worn with shoes. Sandals, open-toe shoes and high heels are not permitted.
d. Long hair (shoulder length and longer) and billowy clothing must be tied back while working in the lab.
2. Food and Drink: NO food or drink will be allowed in the laboratory. This includes coffee, water, candy and chewing gum.
3. Working in the laboratory without an instructor present is strictly forbidden. Students must work in instructional laboratories only during regularly scheduled lab periods and then only when supervised by a member of the faculty.
4. Do not perform any unauthorized experiments. If you have an idea for improving an experiment or for a new experiment, consult with your instructor.
5. Wash your hands after every experiment and each time your hands come in contact with chemicals.
6. Scales: Never weigh reagents or chemicals directly on a balance or scales. First weigh an empty container or weighing paper, then press tare or "re-zero" to set the mass reading to zero. Then add your reagent to the container or weighing paper and re-weigh. Balances are expensive! Clean any spills immediately! Replace caps on bottles and return to cart when complete.
7. Fume hoods should be used when performing experiments that generate an objectionable gas.

## 8. Working With Chemicals:

a. Never smell or taste anything in the laboratory unless specifically directed by your instructor. Many chemicals are poisons. Use your hand to waft the odor to your nose.
b. Always read the label on all chemical bottles and waste bottles. If you see the wrong chemical, you may have a serious explosion. If unsure, consult with your instructor.
c. Do not take chemical bottles to your lab bench unless directed by your instructor. Pour the approximate amount you need from the bottle into a small container and take this to your bench.
d. Always use a metal spatula or scoopula to transfer solid chemicals. Do not use your finger to transfer chemicals. This will directly expose you to the potential hazards of the chemical and might contaminate the remaining chemical in the container.
e. Do not put excess reagent back into the original bottle. There is always a chance of contaminating the original sample. Ask your instructor how to properly dispose of excess chemicals.
f. Do not put pipets directly in any reagent bottle. This might result in contamination of the remaining liquid in the bottle. Never mouth pipet any liquid in the lab.
g. Keep the lids and caps on the chemical bottles. Put the lids back on as soon as you are finished dispensing the material. Many chemicals are sensitive to light or to moisture in the air.
h. When diluting concentrated acids or bases, add the acid or base slowly into water. Never pour water into acid. The heat generated from adding water to a concentrated acid or base solution can cause the solution to splatter or shatter the glass.
9. Waste: Dispose chemical waste in designated containers. Only flush chemicals down the sink if instructed by your instructor. Never pour organic waste down the drain. The waste containers are in the hood for each experiment. Read labels on waste containers to be sure to dispose of waste in the proper container. Disposing waste in the wrong container can generate an unwanted (and unexpected) chemical reaction!
10. Spills: Clean up any spills immediately and dispose of the spilled material properly. Check with your instructor on the proper way to clean up any material that you spill.
11. Chipped or broken glassware should be thrown in the glass waste container. Report broken glassware to your instructor so that it can be replaced.
12. Hot objects will burn! Do not pick up hot objects with your fingers. Use tongs or hot pads. Hot glass will crack if run under cold water. Allow heated glass sufficient time to cool.
13. Accidents and Emergencies: Report all injuries and accidents, no matter how minor, to your instructor immediately. Know the location of the fire extinguishes, fire blankets, safety showers, and eyewash stations. Familiarize yourself with two different exits from the lab, in the event of an emergency situation. Accidents are usually minor, but it is best to be prepared for serious trouble.
14. Be aware of your classmates! Are they obeying the safety rules? A nearby accident may not hurt or harm him/her but may injure you!

## 15. Above all else, ask the instructor if you have any safety related questions!

## Information on Graphs

Graphs: Whenever you create a graph for a chemistry lab, keep the following points in mind:

- If creating a graph by hand, use a large portion of the graph paper to create your graph; small graphs can easily misrepresent data and/or trendlines. If using a computer program like Microsoft Excel, use large graph sizes when creating lab reports (up to the size of one complete page.)
- Plan ahead! Make sure all the data points will fit on the graph but will not be too crowded together horizontally or vertically. Again, use as much of the graph paper as possible when constructing your graph.
- On the vertical axis, label the quantity that is being plotted (i.e. "Time") and put its units in parentheses (i.e. "(seconds)". Do the same on the horizontal axis.
- If you are drawing a best-fit line through the data points, do not connect the dots! Instead, draw a line which has some data points on each side of the line you are drawing... think of your line as an "average" of the data points.
- Never force a graph to go through the origin (i.e. at $x=0$ and $y=0$ ) unless expressly told to do so.
- Examine your graph: are there one or two points which are farther away from the line than the other points? If so, make sure you plotted them correctly.
- Use regression techniques to find the equation for the best fit for your data. ALWAYS include the regression equation with the graph itself.
- Linear regression equations should always be accompanied by the correlation coefficient, $\mathbf{r}$, and not just $R^{2}$. To find $r$ from $R^{2}$, take the square root of $R^{2}$. If the slope is negative, your $r$ value will be negative as well.

An example graph follows:

Page I-ix / Graphs, Types of Glassware, Parts Per Thousand

Page I-x / Graphs, Types of Glassware, Parts Per Thousand

## Parts per Thousand (ppt) Guide

Parts per thousand (ppt), also known as the "relative standard deviation", is useful when comparing the uncertainty between different measurements of varying magnitude (i.e. it is a measure of the precision within an experiment.) Parts per thousand can be applied to any set of data where more than one experimental value has been applied - i.e. volumes, percentages, concentrations, etc. We will use parts per thousand often this year, so knowledge of how it works is critical for the successful student.

For the values $x_{1}, x_{2}$ and $x_{3}$ :

- Take the average of the values

$$
\text { average }=\frac{\text { sum }}{\# \text { of values }}=\frac{x_{1}+x_{2}+x_{3}}{3}
$$

- Find the deviation of each value relative to the average

$$
\begin{gathered}
\text { deviation }_{1}=\text { absolute value }\left(\text { average }-x_{1}\right)=\mid \text { average }-x_{1} \mid \\
\text { deviation }_{2}=\mid \text { average }-x_{2} \mid \\
\text { deviation }=\mid \text { average }-x_{3} \mid
\end{gathered}
$$

- Find the average deviation of the deviations

$$
\text { average deviation }=\frac{\text { sum of deviations }}{\# \text { of values }}=\frac{\text { deviation }_{1}+\text { deviation }_{2}+\text { deviation }_{3}}{3}
$$

- Calculate the parts per thousand (ppt) for the values

$$
\mathrm{ppt}=\frac{\text { average deviation }}{\text { average }} * 1000
$$

Example: Calculate the parts per thousand for the values $35.72 \%, 35.92 \%$ and $36.02 \%$

- Average $=\frac{35.72+35.92+36.02}{3}=\mathbf{3 5 . 8 9} \%$
- Deviation $_{1}=|35.89-35.72|=0.17$
- Deviation $_{2}=|35.89-35.92|=0.03$
- Deviation $_{3}=|35.89-36.02|=0.13$
- average deviation $=\frac{0.17+0.03+0.13}{3}=\mathbf{0 . 1 1 \%}$
- parts per thousand $=\frac{0.11}{35.89} * 1000=\mathbf{3 . 1}$ unitless

Parts per thousand relates the deviation to the magnitude of the experimental data. Consider these two sets of data each with an average deviation of $\pm 0.010$ :

Data set 1: $0.250 \pm 0.010, \mathrm{ppt}=(0.010 / 0.250) \times 1000=40 \mathrm{ppt}($ not very good precision $)$.
Data set 2: $4.50 \pm 0.010, \mathrm{ppt}=(0.010 / 4.50) \times 1000=2 \mathrm{ppt}($ excellent precision)
Although both scenarios have the same deviation, the relative deviation compared to the data gives very different results. Patience and focus is a virtue in this lab.

# Spring 2024 Chemistry 223 with Dr. Michael A. Russell 

For Section 01, Section H1 and Section W1
CH 223, Mt. Hood Community College, Gresham, Oregon, USA 97030

Office: AC 2568
Phone: (503) 491-7348
Email: mike.russell@mhcc.edu or mike.russell@mhchem.org
Office Hours: Held in AC 2568 and, if possible, on Discord (https://discord.gg/ fwhD9tf) every MW 10 AM - 11 and MW noon-1 PM and F 8 AM - 9

Required/Recommended Materials:

* "Chemistry" by The OpenStax College (978-1-947172-62-3),
available here for free: http://mhchem.org/text/OpenStaxChem.pdf
* The Chemistry 223 Companion, purchase here: http://mhcc.edu/bookstore
* Scientific calculator with at least EXP/EE and ln and log (ideally)

Chemistry 223 website:
http://mhchem.org/223

Course Description: This course offers the fundamental basis of chemistry for science, pre-professional, and chemical engineering majors. A strong emphasis is placed on a mathematical approach. The third term covers equilibrium, introduction to acids and bases, spontaneity of reactions, ionic equilibria, oxidation/reduction and electrochemistry. Prerequisites: RD090, WR090 and MTH020, each with a grade of " C " or better, or placement above stated course levels; and CH 222 with a grade of " C " or better.

Course Philosophy: To be successful, students enrolled in a 200 level chemistry course should complete all assignments before coming to class, attend classes regularly, participate in discussions, and think critically. Homework assignments represent the minimum requirement for understanding the principles of chemistry. It is assumed that A and B students will perform enough unassigned exercises to master key concepts. I encourage questions in this class, and I expect a considerable amount of work. If you contact me by email, I will respond to you normally within 24 hours; phone messages are discouraged due to the virus.

The Honor Principle: All students will be expected to behave with the highest moral and academic integrity while enrolled in this class. Plagiarism, cheating or sharing information on tests or laboratory reports, disruptive behavior, and other related offenses will be dealt with according to the directives stated in the current Mt. Hood Community College Student Guide. Offering, asking for, giving or receiving help from a person or website without instructor consent is cheating. Copying and/or sharing any course materials outside this class is not allowed and illegal due to copyright laws.

| Grading: | Midterm Exams (2 total, 140 points each) | 280 points | $28 \%$ of total |
| :--- | :--- | :--- | :--- |
|  | Quizzes (6 total, lowest quiz dropped, 20 points each) | 100 points | $10 \%$ |
|  | Lecture Final Exam | 200 points | $20 \%$ |
|  | Final Lab | 80 points | $8 \%$ |
|  | Class Presentation | 100 points | $10 \%$ |
|  | Problem sets, worksheets, reserve CP topic | 50 points | $5 \%$ |
|  | Nine lab experiments (20 points each) | 180 points | $18 \%$ |
|  | Lab Completion Bonus | $\underline{10 \text { points }}$ | $\underline{1 \%}$ |
|  | Total points: | $\mathbf{1 0 0 0}$ points | $\mathbf{1 0 0 \%}$ |

Tentative grading distribution:
A: $90-100 \% \quad$ B: $80-89 \% \quad$ C: $70-79 \%$
D: $60-69 \%$
F: less than $60 \%$

Opportunities for extra credit are available and explained in the "Extra-Credit Guide" handout.
Exams and Quizzes will be completed exclusively in class (sections 01 and H 1 ) or exclusively online (section W1.) Sections 01 and H1 must turn in assignments in person to avoid a point penalty. Section W1 assignments must be submitted via email to the instructor in a suitable format, and Section W1 must show work on all problems to get full credit.

Labs and Problem Sets will be submitted on campus (sections 01 and H1) or via email (section W1) depending on the student's enrolled section.

Each student will submit a Class Presentation this term - see the "Class Presentation FAQ" for more information.
Details regarding grading will be discussed during the first week of the term.

All assignments can be found on our website (http://mhchem.org/223)
Assignments are different for section W1 and sections 01 and $\mathbf{H 1}$ - contact the instructor if you are unsure which applies to you

- Sections 01 and H1 must bring a printed copy of the lab on the specified day, then turn it in on the deadline during class. Problem sets will be turned in during class; quizzes and exams will be completed during class time. Emailed assignments from Section 01 and H1 students will incur a point penalty, no exceptions.
- Section W1 will email all assignments to the instructor as a single PDF file.

## Week Date

1

4/22-4/26

4/29-5/3

4/8-4/12 Due: Problem set \#1 Chapter 13; 01, H1: due in recitation; W1: due 4/10 by 11:59 PM via email
Due: Quiz \#1; 01, H1: take in recitation; W1: due 4/12 by 9 AM via email
01/H1 Lab: "Le Chatelier's Principle (in class)" (Lab \#3) due next week in recitation
W1 Lab: "Le Chatelier’s Principle (online)" (Lab \#3) due Wednesday, April 17 by 11:59 PM
April 12, 9 AM: Last chance to reserve a Class Presentation topic

4/15-4/19 Due: Problem set \#2 Chapter 14 \& 15; 01, H1: due in recitation; W1: due 4/17 by 11:59 PM
Due: Quiz \#2; 01, H1: take in recitation; W1: due 4/19 by 9 AM
01/H1 Lab: "Titration Calculations (in class)" (Lab \#4) due next week in recitation
W1 Lab: "Titration Calculations (online)" (Lab \#4) due Wednesday, April 24 by 11:59 PM

EXAM \#1 - Chapters 13-15; 01, H1: take in recitation; W1: due 5/3 by 9 AM
Due: "Exam Prep I"; 01, H1: due in recitation; W1: due 5/1 by 11:59 PM
01/H1 Lab: "Titration of Weak Acids (in class)" (Lab \#6) due next week in recitation
W1 Lab: "Titration of Weak Acids (online)" (Lab \#6) due Wednesday, May 8 by 11:59 PM

5/6-5/10 CLASS PRESENTATIONS WEEK
01/H1: Class Presentation paper due at time of presentation during recitation
W1: Class Presentation paper and video due Wednesday, May 8 by 11:59 PM

6/3-6/7 Due: Problem set \#6 Chapter 18 \& 19; 01: due 6/5 at 9 AM in AC 1303; H1: due 6/5 at 1:10 PM in AC 2501; W1: due 6/5 by 11:59 PM
Take Home Quiz \#6 released on website, check email. Sections 01 and H1 must print Quiz \#6 and turn it in on Wednesday. Quiz 6 due dates: 01: due in lecture on Wednesday, June 5 at 9 AM in AC 1303; H1: due in recitation on Wednesday, June 5 at 1:10 PM in AC 2501; W1: due 6/7 by 9 AM via email
Due: "Final Exam Prep Worksheet"; 01: due 6/5 at 9 AM in AC 1303; H1: due 6/5 at 1:10 PM in AC 2501; W1: due 6/5 by 11:59 PM

01/H1 Lab: "QA Group III" (Lab \#8) due same day during lab, 01: 6/3 after Exam II (Memorial Day); H1: 6/5 at 1:10 PM

All extra credit closes Friday, June 7 at 9 AM

6/10-6/12
Due: Problem set \#5 Chapter 16 \& 17; 01, H1: due in recitation; W1: due 5/22 by 11:59 PM
Take Home Quiz \#5 released on website, check email. Sections 01 and H1 must print Quiz \#5 and turn it in on Wednesday. Quiz 5 due dates: 01: due in lecture on Wednesday, May 22 at 9 AM; H1: due in recitation on Wednesday, May 22 at 1:10 PM; W1: due 5/24 by 9 AM
01/H1 Lab: "QA Group I" (Lab \#8) due next week on Wednesday 5/29: Sec 01: 9 AM in AC 1303; Sec H1:1:10 PM in AC 2501

W1 Lab: "Exam Prep Calculations (online)" (Lab \#8) due Wednesday, May 29 by 11:59 PM

EXAM \#2 (Chapter 15-17); 01: take on 6/3, 1:10 PM in AC 2501 (Memorial Day); H1: take on 5/29, 1:10 PM in AC 2501; W1: due 5/31 by 9 AM

Due: "Exam Prep II"; 01: due 5/29 at 9 AM in AC 1303; H1: due 5/29 at 1:10 PM in AC 2501; W1: due 5/29 by 11:59 PM

W1 Lab: "Special Lab (online)" (Lab \#9) due Wednesday, June 5 by 11:59 PM

Take Home Lab Final released by 9 AM Monday, 6/10 for all CH 223 sections. Sections 01 and H1 must print the Take Home Lab Final and turn it in on Wednesday.

Section 01: Take Lecture Final tentatively on Wednesday, June 12 at 8:45 AM in AC 1303. Due: Take Home Lab Final

Section H1: Take Lecture Final tentatively on Wednesday, June 12 at 1:10 PM in AC 2501. Due: Take Home Lab Final

Section W1: Due: Lecture Final (available Monday June 10), and Take Home Lab Final on Wednesday, June 12 by 11:59 PM

## Getting Started in Chemistry 223

Welcome to Chemistry 223! I am glad to have you enrolled in CH 223! Here are some hints on how to get started in the class:

- First, know that I am here to help you succeed in this class. If you have any questions, please email me (mike.russell@mhcc.edu) or stop by the Discord server (https://discord.gg/fwhD9tf) during office hours. I try to respond to student inquiries within 24 hours.
- There are three sections of CH 223 this quarter, namely section $\mathbf{0 1}$ (which meets twice a week on campus), section H1 (which meets only once a week) and section W1 (which is completely online). Sections 01 and H1 will have similar schedules, but section W1 will exhibit some differences. Your experience in this class will depend on which section you are in, so email the instructor (mike.russell@mhcc.edu) if you have any questions about anything, ok?
- Purchase the Chemistry 223 Companion from the MHCC Bookstore. The MHCC Bookstore (http://mhcc.edu/bookstore) will ship you a printed copy of this necessary information; alternatively, you can print the document (on our website), but I do not recommend it due to the size of the Companion. You will need access to printed materials this quarter!
- The "What's Due This Week" Schedule for CH 223 located on page 2 of your syllabus lists all the problem set due dates, assignment deadlines, labs performed, exam/quiz dates, and related information for this term. You can plan your term by referencing this handout.... follow it closely and you will do well in CH 223 !
- Check your email often during Chemistry 223. I will be sending weekly reminders as to "what is due this week" in CH 223 as well as returning some assignments, etc. If you would prefer that I use a non-saints email address to communicate with you, let me know - this is easy to set up!
- The Chemistry 223 website is worth exploring. The Chemistry 223 website has a host of learning opportunities waiting for you. You can download and/or print copies of the syllabus, lecture notes, labs, quiz answers, and more; plus there are opportunities for extra credit available. To get started, send your web browser to:

## http://mhchem.org/223

You should see the CH 223 website on your screen.

- Check out the Chemistry 223 Chapter Guides by selecting "Chapter Guides" from the upper left hand corner of the CH 223 website. The Chapter Guides offer a detailed approach for studying the course material through a series of online and textbook lessons. Read Lesson Zero, the "Intro to the Chapter Guides System," to understand how they work.
- Start thinking about a Class Presentation Topic. You will be giving a five-minute presentation this term on a topic in science that interests you, and you must reserve your topic choice with me BY THE END OF THE SECOND WEEK! A written paper also accompanies the presentation on your compound. To reserve your topic, email the instructor, or go here:

## http://mhchem.org/cp223

The "Class Presentations FAQ" (available in the syllabus or here: http://mhchem.org/cp223info) has more information.

- The Chemistry 223 Textbook is free and legal to download from our website: http://mhchem.org/text/OpenStaxChem.pdf
- Section W1 students: I highly recommend you check out the CamScanner app (http://camscanner.com) in order to send your work to me as a PDF file over email. CamScanner is free and easy to use.... but there are other options besides CamScanner, use the method best for you. Section 01 and H1 students must submit their work on paper for full credit.
- Many opportunities for extra credit exist in this class.... see the Extra Credit Guide for more information: http://mhchem.org/xc
- You can download the entire Microsoft Office suite of programs (Word, Excel, PowerPoint, etc.) for free... see this link for information: https://mhcc.edu/OfficeInstall/

Again, welcome to Chemistry 223! Let me know if I can make your learning experience better in any way, and I look forward to working with you this term! Peace, Dr. Michael Russell (mike.russell@mhcc.edu, 503.491.7348, AC 2568)

# CH 223 CLASS PRESENTATIONS FAQ <br> $F A Q=$ Frequently Asked Questions 

When:
What: A chance to share knowledge with your classmates and the MHCC community
Who: Everyone enrolled in CH 223 (All Sections)
What topic should I pick? For CH 223 , the topic will be a topic in science that interests you. Find a research-quality scientific topic to investigate and complete a report on the topic. All topics must be approved by Dr. Russell using the online form at http://mhchem.org/cp223

Once your topic has been approved and reserved, begin researching interesting information on the topic using the library, internet, etc. You will be preparing a paper on your topic and presenting your work to the class in a short (five minute) presentation.

If you need to change your class presentation topic after the second week of class for any reason you will be penalized 20 points; hence, it's best to reserve a topic early and start researching promptly. Also, if you still have not reserved a topic by the end of the third week, you will be penalized 20 points for tardiness.

Prepare a paper that is at least five full pages of text on your reserved topic. Diagrams, pictures, and other graphics are wonderful, but you will need five full pages of writing for complete credit.

The paper should include a separate cover sheet with the title of your presentation and your name. The paper must be neat, typed, referenced, and interesting to read; spelling and grammar will count. The paper must use a "reasonable" font and font size (Times New Roman, Arial, etc. with size 12 or less); in addition, use $\mathbf{1 " ~}^{\prime \prime}$ margins or less (I will measure!) and no more than "one and a half" spaced type (less than double spaced.) If unsure, ask the instructor.

The paper should also include a separate page at the end with a list of references. References within the paper and at the end should adhere to the "Class Presentations Citation Guide" (found here: http://mhchem.org/cg) For an example paper, see: http://mhchem.org/expaper

What is a peer reviewed scientific article?

How do I find my two peer reviewed scientific articles?

Tell me about the Class
Presentation Rough Draft
Paper

An important aspect of this assignment is to ensure scientific relevancy. To this end, find two peer reviewed scientific articles published within the last ten years that include a reference to your topic. Include the abstracts of these papers with your final Class Presentation paper.

A sure-fire way to access peer-reviewed scientific articles is through the MHCC library's article databases. Go here (https://libguides.mhcc.edu/chemistryguide - you may have to enter your MyMHCC username and password if you are off campus). Select Articles (on the left), then select ScienceDirect College Edition (under "Chemistry Databases") or Academic Search Complete (under "General Databases"), then search for your topic. Remember, your article citation should include the author(s), year of publication, journal title, title of paper, page number(s), volume of journal, etc. and you will need to include the abstract from the peer reviewed article (but not the entire article!) in your report.

Once you conduct a search for your presentation topic, you will likely have a mix of citation/abstractonly and citation/abstract + full-text (whole article) results. You only need the abstract for your paper - do not include the full article. Here is an example of a peer-reviewed scientific paper with an abstract: http://mhchem.org/abstr

During the fourth week, you will be submitting a rough draft of your class presentation paper to the instructor. Ideally this will be the paper in a mostly complete format, but at the very least, two typed pages of text should be submitted.

The rough draft should include at least one peer reviewed scientific paper abstract (with its citation) as well as the Rough Draft Class Presentation form (http://mhchem.org/rd3) The Class Presentation Rough Draft paper is worth 20 points (out of 100 total.)

What should I know when You will be creating a five-minute presentation on your chosen subject. Sections 01 and H1 will give preparing for the presentation?
their presentation during a lab period to their peers; Section W1 will record themselves and upload the video to YouTube for the instructor to view. The presentation must be well prepared and interesting; sloppy preparation shows in the presentation portion. Students can use videos, presentation software (PowerPoint, etc.), posters and chalk to enhance their presentation. Presentation software users will be limited to a maximum of six slides; more invokes a penalty.

Section W1: I encourage students to record themselves on their phone, then upload the video to YouTube, etc. You can send the link (to an unlisted video, not private) to me for watching later. I need to see you for $90 \%$ or more of the presentation for full credit.

Please note that using your paper (or a copy of your paper) during the presentation will result in a ten point penalty. This will prevent you from "reading" your presentation to the audience.

How will I be graded? There are 100 points total for this project. 40 points will reflect the work presented in the paper, 40 points will reflect the work done in the presentation and 20 points will be given for completing the Rough Draft Class Presentation paper.

In addition, failure to turn in the "Class Presentation Reviewer Guide" to the instructor at the end of the day of presentations will result in a ten-point penalty. You will be completing the Reviewer Guide while others are giving their presentations. If curious, you can view this guide on our website (http:// mhchem.org/cp221info). This applies to Sections 01 and H1 only.

Late class presentations will result in a five-point penalty per day. The paper and the presentation must be completed for credit on this assignment. Plagiarism discovered from any source will result in a total Class Presentation grade of zero.

A sample Class Presentation Grading Rubric is available for viewing on the CH 223 website (http://mhchem.org/cgr3). The rubric will allow you to look at the items deemed most important when grading your Class Presentation.

How do I get started? Step 1: Reserve your Class Presentation Topic
Decide on a scientific topic that interest you, then email the instructor or complete the online web form to reserve your topic: http://mhchem.org/cp223

You should receive a response from Dr. Russell within 48 hours after the beginning of the second week of class; if you do not, email him directly at mike.russell@mhcc.edu. Be sure to include alternate topics in case your first choice has already been claimed; he can also pick one for you if you are uncertain which topic to pick. Reserve your class presentation topic by the end of the second week, April 12 at 9 AM. You can see which topics are still available here: http:// mhchem.org/223av

## Step 2: Turn in the Class Presentation Rough Draft Paper

The Class Presentation Rough Draft paper should include at least two typed pages and one peer reviewed scientific article and include the handout (http://mhchem.org/rd3) at the beginning of your paper. Deadline: Mon., April 22 (01) or Wed. April 24 (H1 \& W1)

## Step 3: Give the Class Presentation and turn in your final Class Presentation paper

Section 01 and H1: Bring your final Class Presentation paper and give your presentation during lab. Section 01: Monday, May 6. Section H1: Wednesday, May 8.

Section W1: At the time of your Class Presentation, turn in your final Class Presentation paper and a video recording of your presentation (YouTube link, etc.) by Wed., May 8, 11:59 PM.

Before you present and submit your paper, check out the reminders contained within the "Class Presentation 'Last Minute' Checklist", found here: http://mhchem.org/cpcs Note that you must both present your work and submit your paper to receive any points on this assignment. Also, you cannot "re-use" a Class Presentation topic from CH 221 or CH 222 in CH 223.... these topics must be original for full credit. All presentations over ten minutes in length and all papers with more than 10 pages of writing will suffer a point penalty.
$\qquad$

# CH 223 CLASS PRESENTATIONS ROUGH DRAFT PAPER <br> Staple this form to the top of your Rough Draft Class Presentation Paper for full credit 

## Lab Section:

## Reserved Topic:

## Directions:

- This assignment is worth 20 points out of the 100 points assigned to the Class Presentation assignment.
- Include at least two typed pages of your Class Presentation report with this form (more is fine!)
- Include at least one abstract from a peer reviewed scientific article with a proper citation included (more is fine!)
- This page should be stapled to the top of the other pages in this assignment to avoid a five-point penalty

## Helpful Resources:

- The CH 223 Class Presentation Frequently Asked Questions handout:
- The CH 223 Citation Guide:
http://mhchem.org/faq3
http://mhchem.org/cg

## Class Presentation Rough Draft Paper Due Dates:

- Section 01:
- Section H1:
- Section W1:

April 22 at 1:10 PM
April 24 at 1:10 PM
April 24 at 11:59 PM

Section 01: The final Class Presentation paper is due at the time of your presentation on Monday, May 6.
Section H1: The final Class Presentation paper is due at the time of your presentation on Wednesday, May 8.
Section W1: The final Class Presentation paper and recorded presentation will be due by 11:59 PM on Wednesday, May 8.

## Staying Connected in Chemistry 223 This Quarter

Success in Chemistry 223 often depends on staying connected with the flow of the course... here are some suggestions on how to be aware of what is happening each week:

- Discord is a wonderful medium for keeping students connected while in this class. Our Discord server will offer weekly assignment updates (with links to labs, problem sets, etc.) as well as links to video lectures, tips and hints from the instructor on how to conquer difficult problems, and more! Joining Discord is easy and free; go here (https://discord.gg/fwhD9tf) and join the CH 223 server to get started.
- I'd be honored if you would subscribe to me on YouTube! (http://youtube.com/marsmars2) I create videos for more than just chemistry classes... :)

## Additional Syllabus Materials for Chemistry 223 Available on the Internet

Some or all of these materials might prove useful to you in our class. All of them are available on the Chemistry 223 website under "Class Information".

To access these materials (and more!), go to our website (http://mhchem.org/223) and select "Class Information" from the upper left corner. Additional materials include:

- The "How to Join the Chemistry at MHCC Podcast" guide, which includes step-by-step instructions for joining the class lecture Podcast for this quarter. It also gives information on accessing closed-captions, when available.
- The Extra-Credit Guide - a helpful guide containing some of the extra credit options available to you in this course
- Learning Outcomes for CH 223 - a list of "what you will learn" this quarter
- MHCC College Information - key information that you, as a student at Mt. Hood Community College, might wish to know, including the Student Code of Conduct and Internet Privacy Policy
- A Printable Periodic Table - this periodic table from ScienceNotes.org will certainly be useful in this course, and you will be able to use this type of periodic table on exams and quizzes.

In addition, the website has a plethora of other "goodies" which may be of assistance to you throughout this quarter... feel free to browse, and if you have questions, please do not hesitate to contact me.

[^0]
# CH 223 Spring 2024: <br> '6Introduce Yourself" (in class) Lab: Instructions 

## Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:

## http://mhchem.org/q/1b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of this lab to turn in on the due date. If you do not turn in a printed copy of the lab, there will be a 2 point deduction.

Step Two:
Complete the next page on your own, then turn it in at the beginning of recitation to the instructor on Monday, April 8 (section 01) or Wednesday, April 10 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

Welcome to Chemistry 223! I am glad you enrolled in CH 223 this quarter, and I look forward to an exciting term with you!

On the next page, please confirm the email address you wish me to use in this class with you. Also, please describe your post-CH 223 plans in a brief statement. There are no wrong answers as long as you answer the questions appropriately.

And remember, you can ask me anything (email is best, mike.russell@mhcc.edu).... to a great term!

## Introduce Yourself (in class) Lab - Worksheet

## YOUR NAME:

$\qquad$

## Lab Section:

$\qquad$

## Provide the email address you would like me to use for you this quarter:

The instructor will send messages to this address where it might be observable to other CH 223 students. Using your @saints.mhcc.edu address is great!

Briefly describe your post-Chemistry $\mathbf{2 2 3}$ plans in the space below. (100 words or less)

# CH 223 Spring 2024: ''Determination of an Equilibrium Constant (in class)" Lab-Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/2b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-2-2 through Ia-2-15 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2 -point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, April 1 (section 01) or Wednesday, April 3 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

Step Three:
Complete the lab work and calculations on your own, then turn it in (pages Ia-2-7 through Ia-2-15 only to avoid a point penalty) and your computer generated graph at the beginning of recitation to the instructor on Monday, April 8 (section 01) or Wednesday, April 10 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Determination Of An Equilibrium Constant

In this experiment the equilibrium properties of the reaction between the iron(III) ion and the thiocyanate ion will be studied. The relevant chemical equation for this lab is:

$$
\mathrm{Fe}_{(\mathrm{aq})}^{+3}+\mathrm{SCN}_{(\mathrm{aq})} \rightleftharpoons \mathrm{FeSCN}^{+2}(\mathrm{aq})
$$

$$
\mathrm{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

When solutions of $\mathrm{Fe}^{+3}$ and SCN - are mixed, the above reaction occurs to some extent, forming the complex ion $\mathrm{FeSCN}^{+2}$. The concentrations of $\mathrm{Fe}^{+3}$ and SCN - will decrease by one mole for every mole of $\mathrm{FeSCN}^{+2}$ that forms, but not all of the $\mathrm{Fe}^{3+}$ and SCN - ions will be converted to the complex ion under normal circumstances.

The objective of this experiment is to determine the equilibrium constant, $\mathbf{K}_{\mathbf{c}}$, for this reaction. The value of $\mathrm{K}_{\mathrm{c}}$ is constant at a given temperature. Any mixture of $\mathrm{Fe}^{+3}$ and SCN - will react until the same value of $\mathrm{K}_{\mathrm{c}}$ is obtained. In this experiment, we will determine $\mathrm{K}_{\mathrm{c}}$ for this reaction using several different mixtures of $\mathrm{Fe}^{+3}$ and SCN-

Before we can calculate the value of the equilibrium constant, we must be able to determine the concentration of $\mathrm{FeSCN}^{+2}$ in solution. The Beer-Lambert Law, which is commonly referred to as simply Beer's Law, relates the absorption of light in a colored sample to its concentration in solution:

$$
A=\varepsilon b c=\log (100 \% / \% T)
$$

Here $\mathbf{A}$ is the measured absorbance of the colored solution, $\varepsilon$ is the molar absorptivity (with units of $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ), $\mathbf{b}$ is the path length (in cm ), and $\mathbf{c}$ is the concentration (molarity, or moles per Liter) of the species being studied, in this case $\mathrm{FeSCN}^{+2}$. The value of the molar absorptivity, $\varepsilon$, depends on the solute's overall energy stored within the molecule. $\mathrm{FeSCN}^{2+}$ has a deep red color while the reactants are virtually colorless, and only $\mathrm{FeSCN}^{2+}$ will absorb light in the visible region.

Absorbance is a unitless quantity that corresponds with the amount of light removed by a colored system. Depending on if you use an analog Spectronic 21 or a digital Vernier SpectroVis, you may need to measure the percent transmittance (\%T), or how much light gets through colored solutions. Calculating absorbance from $\% \mathrm{~T}$ is straightforward $(\mathrm{A}=\log (100 \% / \% \mathrm{~T})$.

Because $\mathrm{FeSCN}^{+2}$ has a red color, we will use a wavelength appropriate for measuring red light - the SpectroVis will tell us what the exact wavelength will be, but it should be about 450 nm (which is what you'll use when utilizing the Spectronic 21.) Using the Beer's Law equation, we can determine the molar absorptivity constant, $\varepsilon$, for $\mathrm{FeSCN}^{+2}$ by measuring its absorbance at different known concentrations of $\mathrm{FeSCN}^{2+}$. If absorbance is plotted versus concentration, the slope will give the molar absorptivity constant using Beer's Law.

Finding the concentration of $\mathrm{FeSCN}^{+2}$ can be achieved using Le Chatelier's Principle. If an excess of $\mathrm{Fe}^{3+}$ is added to a small amount of SCN -, one can assume that the amount of SCN - present in solution equals the amount of $\mathrm{FeSCN}^{2+}$ formed at equilibrium. In other words, we know the final concentration of $\mathrm{FeSCN}^{+2}$ in the solution by creating a solution that is not in equilibrium but goes to completion using the principle of limiting reagent. The SCN - will be completely converted to $\mathrm{FeSCN}^{+2}$, such that the final concentration of $\mathrm{FeSCN}^{+2}$ is equal to the initial concentration of SCN -

The purpose of this lab is to find the value of the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$. First, you will prepare a series of
solutions with known concentrations of $\mathrm{FeSCN}^{2+}$ (or SCN -) and measure the absorbance (or percent transmittance) values at a wavelength appropriate for a red solution around 450 nm . When the absorbance values are plotted versus the concentration of $\mathrm{FeSCN}^{2+}$, a linear relationship appears, and $\varepsilon$ can be calculated using linear regression (the slope equals $\varepsilon b$.). Remember to report the value of the slope, y-intercept and correlation coefficient when using linear regression. $\varepsilon$ will allow you to calculate the concentration of $\mathrm{FeSCN}^{2+}$ for any combination of $\mathrm{Fe}^{3+}$ and SCN -. You will then prepare a series of solutions with varying amounts of $\mathrm{Fe}^{3+}$ and $\mathrm{SCN}^{-}$initially present, determine the absorbance for $\mathrm{FeSCN}^{2+}$, and finally determine the value of $\mathrm{K}_{\mathrm{c}}$ at room temperature.

## PROCEDURE:

In Part A, the goal is to find the molar absorptivity constant, and in Part B, you will find the value of the equilibrium constant. Both parts use similar techniques, but make sure you use the correct reactant concentrations in each section. Check and double-check the concentrations before analyzing your solutions!

Before you leave lab, it is important that you share data with the other group members (essentially mL of KSCN and absorbance (or \%Transmittance) values). Also make sure to get all of the names of your lab partners for your final lab report.

## Part A: Determining the Molar Absorptivity Constant ( $\varepsilon$ )

Place approximately 30 mL of $\mathbf{0 . 1 0 0} \mathbf{M ~ F e}\left(\mathbf{N O}_{3}\right)_{3}$ in $1 \mathrm{M} \mathrm{HNO}_{3}$ in a dry labeled 100 mL beaker. The $\mathrm{HNO}_{3}$ allows the solute components to remain in solution, but it does not affect our calculations in this lab. Note also that there are two different stock solutions of $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ and KSCN at different concentrations. Make sure you choose the correct solution for part A or your experiment will not work! NEVER place solution back into the reagent bottle - once the solution is removed, the solution has to be placed in the waste bottle.

Place approximately 20 mL of $\mathbf{3 . 0 0} \times \mathbf{1 0}^{-4} \mathbf{M}$ KSCN into a second dry labeled 100 mL beaker. Clean and dry six $18 \times 150 \mathrm{~mm}$ test tubes and label 1-5 and B (blank).

Pipet 5.00 mL of the $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ solution into tubes 1-5 as demonstrated by the instructor. NEVER pipet directly from the bottle, only pipet from a beaker. Pipet $1,2,3,4$, or 5 mL of KSCN into the corresponding labeled test tube. Then add the correct number of mL of water to each test tube so that the total volume is 10.00 mL . The sixth test tube is the blank (or "dark tube') and will contain only water.

You will need to transfer a small quantity of each solution into a cuvette for analysis on your instrument (see below); ideally you will have six cuvettes, one for each of the test tubes from above. Make sure the cuvette is filled to at least $80 \%$ of the maximum volume to ensure that light flows through the sample.

You will be using either a Spectronic 21 or a SpectroVis Plus. Follow the appropriate instructions:

## Spectronic 21:

Determine the $\% \mathrm{~T}$ for each of the five solutions using a Spec 21 at 450 nm . Assume the path length, b , equals 1.00 cm for these trials. Convert the \%T readings into absorbance. Recall that $\mathrm{A}=\log (100 \% / \% \mathrm{~T})$.

## SpectroVis Plus:

- Connect the SpectroVis Plus to the LabQuest II. If everything is correct, you should see "USB: Abs" on the screen.
- Place the blank cuvette (with water only) in the SpectroVis, noting the arrow (and direction of light - do not place the "ribbed" walls of the cuvette face the arrow or source of light symbol.)
- Select "Sensors -> Calibrate -> USB: Spectrometer", then press OK if necessary. The following message is displayed: "Waiting 90 seconds for lamp to warm up..." After 90 seconds, the message will change to "Warmup complete" then select "Finish Calibration". When the message "Calibration completed" appears, select OK.
- Place one of the $\mathrm{FeSCN}^{2+}$ samples in the SpectroVis. Start data collection by pushing the green "start" button in the lower left corner of the LabQuest 2 . A full spectrum graph of the solution will be displayed. Stop data collection (by pressing the red button in the lower left corner) and move the cursor to the maximum wavelength at about 450 nm ; this is the wavelength of maximum absorbance ( $\lambda$ max). Record both the wavelength of maximum absorbance and the actual absorbance value in your lab notebook.
- Remove the cuvette and place a new cuvette (with another solution) inside. Repeat the above process until all solutions have recorded values of absorbance and the corresponding $\lambda$ max (and they should all be about 450 nm .)

You should see a linear relationship between mL of KSCN added and Absorbance; if not, you might want to redo the measurements. Dispose of the solutions in the waste bottle and clean your beakers and test tubes.

## Part B: Determining the Equilibrium Constant (K)

Place approximately 30 mL of $\mathbf{2 . 0 0} \times \mathbf{1 0}^{-\mathbf{3}} \mathbf{M} \mathbf{F e}\left(\mathbf{N O}_{\mathbf{3}}\right)_{3}$ in $1 \mathrm{M} \mathrm{HNO}_{3}$ in a dry labeled 100 mL beaker. Place approximately 20 mL of $\mathbf{2 . 0 0} \mathbf{x} \mathbf{1 0}^{-\mathbf{3}} \mathbf{~ M ~ K S C N}$ in a second dry labeled 100 mL beaker. Clean and dry five 18 x 150 mm test tubes and label 1-5.

Pipet 5.00 mL of the $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ solution into tubes 1-5. Pipet 1, 2, 3, 4, or 5 mL of KSCN into the corresponding test tube. Then add the correct number of mL of water to each test tube so that the total volume is 10.00 mL .

Determine the absorbance or \%T for each of the five solutions using the Spec 21 (at 450 nm ) or the SpectroVis Plus as before. Assume $b=1.00 \mathrm{~cm}$. Convert the $\%$ T readings into absorbance values if using the Spec 21 (the SpectroVis does this automatically for you.) You should see a linear relationship between the concentration of KSCN added and Absorbance; if not, you might want to re-do the measurements. Dispose of the solutions in the waste bottle when complete.

Calculations for Part A: Finding the value of $\varepsilon$
Determine the diluted molarity of $\mathrm{Fe}^{+3}$ and of SCN - present in each solution using the dilution equation $\left(\mathrm{M}_{1} \mathrm{x}\right.$ $V_{1}=M_{2} \times V_{2}$ ).

Example: Find the concentration of SCN- when 4.00 mL of a $3.00 * 10^{-4} \mathrm{M} \mathrm{KSCN}$ is diluted to a total of 10.00 mL .

Solution: The initial concentration of KSCN, $3.00 * 10^{-4} \mathrm{M}$, is being diluted to a new solution volume of 10.00 mL . We can use $\mathrm{M}_{1} \times \mathrm{V}_{1}=\mathrm{M}_{2} \times \mathrm{V}_{2}$ equation and solve for $\mathrm{M}_{2}$.
$\mathrm{M}_{2}=3.00 * 10^{-4} \mathrm{M} * 4.00 \mathrm{~mL} / 10.00 \mathrm{~mL}=\mathbf{1 . 2 0} * \mathbf{1 0}^{-4} \mathbf{M}$
Page Ia-2-4 / Determination of an Equilibrium Constant Lab (in class) for Sections 01 and H1

Find the concentration of $\mathrm{FeSCN}^{2+}$ using the law of limiting reactants.
Example: Find the concentration of $\mathrm{FeSCN}^{2+}$ when $\left[\mathrm{SCN}^{-}\right]=1.20 * 10^{-4} \mathrm{M}$ and $\left[\mathrm{Fe}^{3+}\right]=0.100 \mathrm{M}$.

Solution: Since $[\mathrm{SCN}-] \ll\left[\mathrm{Fe}^{3+}\right]$, it can be assumed that all of the $\mathrm{SCN}^{-1}$ has been converted to $\mathrm{FeSCN}^{2+}$ using Le Chatelier's Principle. Hence, the $\left[\mathrm{FeSCN}^{2+}\right]$ at equilibrium equals $\mathbf{1 . 2 0}$ * $\mathbf{1 0}^{-\mathbf{4}} \mathbf{M}$ in this example. Note: in part B you will use the value of $\varepsilon$ and the absorbance to calculate $\left[\mathrm{FeSCN}^{2+}\right]$.

Construct a graph of absorbance versus the concentration of $\mathrm{FeSCN}^{2+}$ on a computer or tablet (no hand drawn graphs.) Perform a linear regression on the data, and record your values of the slope, the y-intercept and the correlation coefficient (r). Determine the value of $\varepsilon$ from the slope (remember that the path length, b, equals 1.00 cm .) Print this graph and include it with your final lab report.

Calculations for Part B: Finding the value of $K$
To analyze this set of data, determine the initial molarity of $\mathrm{Fe}^{+3}$ and of $\mathrm{SCN}^{-}$present in each of your five solutions. See the section in Part A for assistance on this procedure.

Calculate the equilibrium concentration of $\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}}$ in each sample. This can be done using Beer's Law and the molar absorptivity constant determined in part $\mathrm{A} . \mathbf{c}_{\mathrm{FeSCN}}=\mathbf{A} / \mathbf{b} \varepsilon$

Example: Calculate the equilibrium concentration of $\mathrm{FeSCN}^{2+}$ when $\varepsilon=3420 \mathrm{~cm}^{-1} \mathrm{M}^{-1}, \% \mathrm{~T}=45.2 \%$, and $\mathrm{b}=1.00 \mathrm{~cm}$.

Solution: First convert \%T to absorbance. $\mathrm{A}=\log (100 \% / 45.2 \%)=0.345$
Now solve for the concentration, $\mathrm{c} . \mathrm{c}=\mathrm{A} / \mathrm{b} \varepsilon=0.345 / 1.00 \mathrm{~cm} * 3420 \mathrm{~cm}^{-1} \mathrm{M}^{-1}=\mathbf{1 . 0 0} * \mathbf{1 0}^{-4} \mathbf{M}$

Next, find the equilibrium concentrations of $\left[\mathrm{Fe}^{+3}\right]$ and $[\mathrm{SCN}-]$ using the following equations:

$$
\begin{aligned}
& {\left[\mathrm{Fe}^{+3}\right]_{\mathrm{eq}}=} {\left.\left[\mathrm{Fe}^{+3}\right]\right]_{\mathrm{ini}}-\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} \text { and }[\mathrm{SCN}-]_{\mathrm{eq}}=[\mathrm{SCN}-]_{\mathrm{ini}}-\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} } \\
& \text { where } \mathbf{e q}=\text { equilibrium concentration and } \mathbf{i n i}=\text { initial concentration }
\end{aligned}
$$

An ICE table may also be helpful (note that $\mathrm{x}=\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}}$ ):

|  | $\left[\mathrm{Fe}^{3+}\right]$ | $[\mathrm{SCN}]$ | $\left[\mathrm{FeSCN}{ }^{2+}\right]$ |
| ---: | :---: | :---: | :---: |
| initial | $\left[\mathrm{Fe}^{3+}\right]_{0}$ | $\left[\mathrm{SCN}^{-}\right]_{0}$ | 0 |
| change | -x | -x | +x |
| equilibrium | $\left[\mathrm{Fe}^{3+}\right]_{0}-\mathrm{x}$ | $\left[\mathrm{SCN}^{-}\right]_{0}-\mathrm{x}$ | x |
|  |  |  |  |

Page Ia-2-5 / Determination of an Equilibrium Constant Lab (in class) for Sections 01 and H1

Finally, calculate the equilibrium constant, $\mathbf{K}_{\mathbf{c}}$, for each of the five solutions:

$$
\begin{aligned}
& \mathbf{K}_{\mathrm{c}}=\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} /\left\{\left[\mathrm{Fe}^{+3}\right]_{\mathrm{eq}} *\left[\mathrm{SCN}^{-}\right]_{\mathrm{eq}}\right\} \quad \text { or: } \\
& \text { (x) } \\
& \mathrm{K}_{\mathrm{c}}=\frac{(\mathrm{x})}{\left(\left[\mathrm{Fe}^{+3}\right]_{0}-\mathrm{x}\right)\left(\left[\mathrm{SCN}^{-}\right]_{0}-\mathrm{x}\right)}
\end{aligned}
$$

You should have five values of $\mathrm{K}_{\mathrm{c}}$ that are all relatively close to each other.

Determine the average $\mathrm{K}_{\mathrm{c}}$ value and deviation in parts per thousand (pt) for your calculations. See the ppt handout on the CH 223 website or here: https://mhchem.org/ppt

# Determination of an Equilibrium Constant 

$\qquad$ LAB PARTNER(s):

Purpose: To determine the value of an equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ for the following reaction:

$$
\mathrm{Fe}^{+3}(\mathrm{aq})+\mathrm{SCN}^{-(\mathrm{aq})}{ }^{( } \mathrm{FeSCN}^{+2}(\mathrm{aq}) \quad \mathrm{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

## Goal \#1: Obtain the Data

a. Create the five solutions as discussed in Part A on page I-2-3. Use the Spec-21 or SpectroVis to determine the absorbance (and \%Transmittance, if necessary) for each of the five solutions.

Data check: The solutions should get progressively more orange/red as the mL of KSCN increase ( 1.00 mL will be the most dilute, 5.00 mL the most intense.) Also, as mL KSCN increase, the \%Transmittance will decrease and the Absorbance increase. If these are not observed, re-create your solutions and try again.

## Part A:

| mL KSCN | \%Transmittance (if necessary) | $\underline{\mathrm{mL} \mathrm{KSCN}}$ | Absorbance |
| :---: | :---: | :---: | :---: |
| 1.00 |  | 1.00 |  |
| 2.00 |  | 2.00 |  |
| 3.00 |  | 3.00 |  |
| 4.00 |  | 4.00 |  |
| 5.00 |  | 5.00 |  |

Notes: (optional)

## Goal \#1 (continued)

b. Create the five solutions as discussed in Part B on page I-2-4. Use the Spec-21 or SpectroVis to determine the absorbance (and \%Transmittance, if necessary) for each of the five solutions.

If converting from $\%$, Absorbance $=\mathbf{l o g}(\mathbf{1 0 0 \%} / \mathbf{/} \mathbf{~ T r a n s m i t t a n c e})$ use base $10 \log$, not natural log (ln)!

Data check: As before, the solutions should get progressively more orange/red as the mL of KSCN increase ( 1.00 mL will be the most dilute, 5.00 mL the most intense.) Also, as mL KSCN increase, the \%Transmittance will decrease and the Absorbance increase. If these are not observed, re-create your solutions and try again.

## Part B:

| mL KSCN | \%Transmittance | mL KSCN | Absorbance |
| :---: | :---: | :---: | :---: |
| 1.00 |  | 1.00 |  |
| 2.00 |  | 2.00 |  |
| 3.00 |  | 3.00 |  |
| 4.00 |  | 4.00 |  |
| 5.00 |  | 5.00 |  |

Notes: (optional)

Goal \#2: Determine the value of $\varepsilon$ We will convert the $m L$ of KSCN into a concentration of KSCN. In Part A, the $[\mathrm{KSCN}] \ll\left[\mathrm{Fe}^{3+}\right]$, so we can assume that $[\mathrm{KSCN}]=\left[\mathrm{FeSCN}^{2+}\right]$. Next we will convert the $\%$ Transmittance values into Absorbance, then make a plot of Absorbance versus [FeSCN ${ }^{2+}$ ]. Finally, a linear regression of the Absorbance versus [FeSCN ${ }^{2+}$ ] data will lead us to the value of $\varepsilon$, the molar absorptivity coefficient, which will be used in the next section.
a. Convert $\mathbf{m L}$ of KSCN into the diluted concentration of [KSCN] (molarity) using $\mathbf{M}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}$ $=3.00 \times 10^{-4} \mathbf{M}$ for the initial molarity of KSCN and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. (see page I-2-4 for an example.)
b. Since $[\mathrm{KSCN}] \ll\left[\mathrm{Fe}^{3+}\right]$ in part A, so we can assume that $[\mathbf{K S C N}]=\left[\mathbf{F e S C N}^{2+}\right]$. Write the values for $\left[\mathrm{FeSCN}^{2+}\right]$ in the next column... these will be the x -axis values for your graph. (see page I-2-4 and 1-2-5 for an example.)

| $\operatorname{mLKSCN}\left(\mathrm{V}_{1}\right)$ | diluted $[\mathrm{KSCN}]\left(\mathrm{M}_{2}\right)$ | $-\left[\mathbf{F e S C N}^{2+}\right](\mathbf{M})$ |
| :--- | :--- | :--- |
| 1.00 | - | - |
| 2.00 | - | - |
| 3.00 | - |  |
| 4.00 | - |  |

Show an example of your work by converting 3.00 mL KSCN into a diluted [KSCN] and then into $\left[\mathrm{FeSCN}^{2+}\right]$ in the space below.

## Goal \#2 (continued)

c. Rewrite your Absorbance values for Part A into the following table (Goal \#1, part a) as well as your values for $\left[\mathrm{FeSCN}^{2+}\right]$ (Goal \#2, part b).

| mL KSCN | Absorbance (Part A) | $\left[\mathrm{FeSCN}^{2+}\right](\mathrm{M})$ |
| :--- | :--- | :--- |
| 1.00 | - | - |
| 2.00 | - | - |
| 3.00 | - |  |
| 4.00 | - |  |
| 5.00 | - |  |

d. Create a computer-generated graph in a program like Excel, Sheets, Numbers, etc. with Absorbance versus [FeSCN ${ }^{2+}$ ] (Goal \#2, part c). Include the graph with this lab report. Graphs should be labeled correctly with appropriate axes, and the data should follow a straight line with a positive slope.

Absorbance values are unitless and will constitute the $y$-axis in the graph. The values for $\left[\mathrm{FeSCN}^{2+}\right]$ will be the x -axis in the graph.
e. Perform a linear regression of the values used in Goal \#2, part d above (Absorbance versus [FeSCN ${ }^{2+}$ ]). You can do this in the graphing program you used in Goal \#2 part d above, or on your calculator, or using an online linear regression calculator (for example: http://www.alcula.com/calculators/statistics/linear-regression/) The slope of the line equals $\varepsilon$, the molar absorptivity coefficient, which we will use in Goal \#3 next.

The slope should have a value $>1000$.

Report the values for slope ( $\varepsilon$ ), y-intercept and the correlation coefficient (r) obtained from the linear regression below:
slope $=\varepsilon=$ $\qquad$
y -intercept $=$ $\qquad$
correlation coefficient $(\mathrm{r})=$ $\qquad$ (r is not the same as $R^{2}$ !)

Goal \#3: Determine the value of $\mathbf{K}_{\mathbf{c}}$. We will convert the $m L$ of $K S C N$ and $F e^{3+}$ into diluted concentrations of $K S C N$ and $\mathrm{Fe}^{3+}$ in a method similar to that of Goal \#2. We will convert the Part B \%Transmittance values into absorbance, then we can use our $\varepsilon$, the molar absorptivity coefficient, to calculate the equilibrium concentrations of FeSCN ${ }^{2+}$ using the Beer-Lambert Law. Finally, using ICE tables, we will calculate the equilibrium concentrations of $\mathrm{Fe}^{3+}, \mathrm{SCN}^{-1}$ and $\mathrm{FeSCN}{ }^{2+}$ in order to calculate $K_{c}$, the equilibrium constant for this lab.
a. Convert mL of KSCN into the diluted concentration of [KSCN] (molarity) using $\mathbf{M}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}$ $=\mathbf{2 . 0 0} \times 10^{-\mathbf{3}} \mathbf{M}$ for the initial molarity of KSCN and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. (see page $I-2-4$ and Goal \#2 section a for examples.)
b. Convert $\mathbf{m L}$ of $\mathbf{F e}^{3+}$ into the diluted concentration of $\left[\mathrm{Fe}^{3+}\right]$ (molarity) using $\mathbf{M}_{1} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}=$ $2.00 \times 10^{-3} \mathbf{M}$ for the initial molarity of $\mathrm{Fe}^{3+}$ and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. These calculated $M_{2}$ values should all be the same since the initial volume ( $V_{l}$ ) are identical! (see page I-2-4 and Goal \#2 section a for examples.)

| $\underline{\mathrm{mLKSCN}}\left(\mathrm{V}_{1}\right)$ | diluted [KSCN] ( $\mathbf{M}_{2}$ ) | $\underline{\mathrm{mLFe}}{ }^{3+}\left(\mathrm{V}_{1}\right)$ | diluted $\left[\mathrm{Fe}^{3+}\right]\left(\mathrm{M}_{2}\right)$ |
| :---: | :---: | :---: | :---: |
| 1.00 |  | 5.00 |  |
| 2.00 |  | 5.00 |  |
| 3.00 |  | 5.00 |  |
| 4.00 |  | 5.00 |  |
| 5.00 |  | 5.00 |  |

Note:

- We will refer to "diluted $[\mathrm{KSCN}]$ " values as $\left[\mathbf{S C N}^{-1}\right]_{\mathrm{i}}$ in Goal \#3, part e, below
- We will refer to "diluted $\left[\mathrm{Fe}^{3+}\right]$ " values as $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{i}}$ in Goal \#3, part f, below

Show an example of your work by showing how to convert 3.00 mL KSCN into a diluted [KSCN]:

Show an example of your work by showing how to convert $5.00 \mathrm{~mL} \mathrm{Fe}{ }^{3+}$ into a diluted $\left[\mathrm{Fe}^{3+}\right]$ :

## Goal \#3 (continued)

c. Rewrite your Absorbance (and \%Transmittance values, if used) for Part B into the following table (Goal \#1, part b).

Absorbance values are unitless and will constitute the $y$-axis in the graph.

| mL KSCN | \%Transmittance (ifused) | Absorbance (Part B) |
| :--- | :--- | :--- |
| 1.00 | - | - |
| 2.00 | - | - |
| 3.00 | - | - |
| 4.00 | - |  |
| 5.00 | - |  |

d. Using Beer-Lambert Law, we can convert your Absorbance (A) values (Goal \#3, part c) into concentration of $\left[\mathrm{FeSCN}^{2+}\right]$ using:

Absorbance $=\mathbf{A}=\varepsilon$ bc

In this equation, $\mathbf{A}=$ Absorbance (Goal \#3, part c), $\varepsilon=$ the molar absorptivity coefficient (from Goal \#2, part e), $\mathbf{b}=$ path length (for this lab, $\mathrm{b}=1.00 \mathrm{~cm}$ ) and $\mathbf{c}=$ concentration of $\left[\mathrm{FeSCN}^{2+}\right]($ in $\mathrm{mol} / \mathrm{L}$, or just M$)$. You want to solve for the equilibrium concentration of $\left[\mathrm{FeSCN}^{2+}\right]$, so $\mathbf{c}=\mathbf{A} / \varepsilon \mathbf{b}$
value of $\varepsilon=$ $\qquad$ (from Goal \#2, part e)

| mL KSCN | Absorbance |
| :--- | :--- |
| 1.00 |  |
| 2.00 |  |
| 3.00 |  |
| 4.00 |  |
| 5.00 |  | $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{ea}}(\mathrm{M})$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Goal \#3 (continued)

e. We can use the values of $\left[\mathbf{F e S C N}^{2+}\right]_{\text {eq }}$ from Goal \#3, part $d$ (above) to find the equilibrium values of $\left[\mathrm{SCN}^{-1}\right]$ or $\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$. To find the equilibrium values of $\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$ do the following:

$$
\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}=\left[\mathrm{SCN}^{-1}\right]_{\mathrm{i}}-\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}
$$

- $\left[\mathbf{S C N}^{-1}\right]_{i}$ values can be found in Goal \#3, part b above
- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above

| mL KSCN | $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ | $\left[\mathrm{SCN}^{-1}\right]_{\text {eq }}$ |
| :---: | :---: | :---: |
| 1.00 |  |  |
| 2.00 |  |  |
| 3.00 |  |  |
| 4.00 |  |  |
| 5.00 |  | , |

f. In a similar fashion, we can use the values of $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}$ from Goal \#3, part d to find the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]$ or $\left[\mathrm{Fe}^{3+}\right]_{\text {eq }}$. To find the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}}$ do the following:

$$
\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}}=\left[\mathrm{Fe}^{3+}\right]_{\mathrm{i}}-\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}
$$

- $\left[\mathrm{Fe}^{3+}\right]_{i}$ values can be found in Goal \#3, part b above - they should be all identical!
- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above

| $\underline{\mathrm{mLFe}}{ }^{3+}$ | $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ | $\left[\mathrm{Fe}^{3+}\right]_{\text {eq }}(\mathbf{M})$ |
| :---: | :---: | :---: |
| 5.00 |  |  |
| 5.00 |  |  |
| 5.00 |  |  |
| 5.00 |  |  |
| 5.00 |  |  |

## Goal \#3 (continued)

g. We can use the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}},\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$ and $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}$ to calculate the value of $\mathbf{K}_{\mathbf{c}}$.

$$
\mathbf{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above
- $\left[\mathbf{S C N}^{-1}\right]_{\text {eq }}$ values can be found in Goal \#3, part e above
- $\left[\mathrm{Fe}^{3+}\right]_{\text {eq }}$ values can be found in Goal \#3, part $f$ above
$\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }} \quad\left[\mathbf{S C N}^{-1}\right]_{\text {eq }} \quad\left[\mathrm{Fe}^{3+}\right]_{\text {eq }} \quad \mathbf{K}_{\boldsymbol{c}}$

## Average of five $K_{c}$ values =

$\qquad$

Parts per thousand $=$ $\qquad$

## Info on parts per thousand: https://mhchem.org/ppt

In the space below, show how you calculated the first $\mathrm{K}_{\mathrm{c}}$ value, the average of the five $\mathrm{K}_{\mathrm{c}}$ values, and the parts per thousand.

## Postlab Questions:

A student mixes 5.00 mL of $2.00 \times 10^{-3} \mathrm{M} \mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ with $5.00 \mathrm{~mL} 2.00 \times 10^{-3} \mathrm{M} \mathrm{KSCN}$. She finds that in the equilibrium mixture the concentration of $\mathrm{FeSCN}^{+2}$ is $1.40 \times 10^{-4} \mathrm{M} . \quad \mathbf{F e}^{+3}{ }_{(\mathrm{aq})}+\mathbf{S C N}_{(\mathrm{aq})} \rightleftharpoons \mathrm{FeSCN}^{+2}(\mathrm{aq})$
a. What is the initial concentration in solution of the $\mathrm{Fe}^{+3}$ and $\mathrm{SCN}-$ ?
b. Create an ICE table for this problem. What is the equilibrium constant value for this reaction?

## This page left blank for printing purposes

# CH 223 Spring 2024: 'Le Chatelier's Principle (in class)" Lab - Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/3b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-3-2 through Ia-3-12 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2-point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, April 8 (section 01) or Wednesday, April 10 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

Step Three:
Complete the lab work and calculations on your own, then turn it in (pages Ia-3-7 through Ia-3-12 only to avoid a point penalty) at the beginning of recitation to the instructor on Monday, April 15 (section 01) or Wednesday, April 17 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Le Chatelier's Principle

Chemical systems tend to exist in a state of equilibrium. If this equilibrium is disturbed, the reaction may shift in the forward or reverse direction. If the principles governing the equilibrium system are understood, then predictions can be made as to how to drive the reaction in the forward or reverse directions.

In the following equilibrium system, in which $\mathrm{A}, \mathrm{B}$, and C are molecules or ions in solution, their relative concentrations at a given temperature must equal a constant, $\mathbf{K}$ :

$$
\mathbf{a} \mathbf{A}(\mathbf{a q}) \rightleftharpoons \overline{\mathrm{b}} \overline{\mathbf{B}}(\mathbf{a q})+\mathbf{c} \widetilde{\mathbf{C}}(\mathbf{a q}) \quad \quad \text { equilibrium constant }=\mathrm{K}=\frac{[\mathrm{B}]^{b}[\mathrm{C}]^{c}}{[\mathrm{~A}]^{a}}
$$

For K to remain constant, if any concentrations are altered, the other components must also shift in concentration. For example, if the concentration of A is increased, the concentrations of B and C will also increase to keep $K$ at a constant value. The reaction shifts in the forward direction. If the concentration of $B$ or C is increased, the reaction will shift in the reverse direction thereby increasing the concentration of A and lowering the concentrations of both B and C . Furthermore, if the concentration of A is reduced, the reaction will shift in the reverse direction, lowering the concentrations of B and C and subsequently increasing the concentration of A to balance the equilibrium. If you attempt to change a system in chemical equilibrium, it will react in such a way to counterbalance the change you attempted.

In addition to changes in concentration, a change in the temperature of the system will affect the equilibrium. If the reaction is exothermic in the forward direction, such that heat is a product, an increase in temperature will shift the reaction in the reverse direction. Therefore, an increase in temperature favors the endothermic reaction.

In solution, there are often more than one equilibria maintained. The most important equilibrium involves the dissociation of water:

$$
\mathbf{H}_{2} \mathbf{O}(\mathbf{l}) \rightleftharpoons \mathbf{H}^{+}(\mathbf{a q})+\mathbf{O H}(\mathbf{a q})
$$

This equation must always be in equilibrium in aqueous solution. If $\mathrm{H}^{+}$ion or $\mathrm{OH}^{-}$ion are present in another equilibrium solution, the equilibrium can be affected by adding acid or base to the system (parts A and D in the procedure). However, if neither $\mathrm{H}^{+}$ion nor $\mathrm{OH}^{-}$ion is present in the equilibrium equation, the equilibrium will not be influenced by the addition of acids or bases (parts B and C).

## PROCEDURE:

In this experiment you will work with several equilibrium systems, varying conditions such as temperature and concentrations thereby forcing shifts in the forward or reverse directions. You will be asked to interpret your observations in terms of the principles presented above.

The waste from parts B and C should be poured in a waste bottle. Parts A and D may be poured down the drain.

## PROCEDURE: Part A: Solubility Equilibrium: Finding a value for $K_{\text {sp }}$

Many ionic compounds have limited water solubility, dissolving only partially in water. An example is $\mathrm{PbCl}_{2}$ :

$$
\mathbf{P b C l}_{2}(\mathbf{s}) \rightleftharpoons \mathbf{P b}^{+2}(\mathbf{a q})+2 \mathbf{C l}-(\mathbf{a q}) \quad \mathbf{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{+2}\right]\left[\mathrm{Cl}^{-}\right]^{2}
$$

The concentration of $\mathrm{PbCl}_{2}$ does not enter into the equilibrium equation because it is a solid and therefore has a constant effect on the system, independent of its amount. The equilibrium constant for a solubility equilibrium is called the solubility product constant and symbolized as $\mathbf{K}_{\text {sp }}$. For this equilibrium to exist, there must be some solid $\mathrm{PbCl}_{2}$ present in the system. If there is no solid present, there is no equilibrium.

1. Set up a hot water bath using a 400 mL beaker for step 2 below. To a (room temperature) test tube, add 5.0 $\mathrm{mL} 0.30 \mathrm{M} \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$. Add 0.30 M HCl in 0.5 mL increments ( 10 drops) to the $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ until a white precipitate forms.
a. Record the volume of HCl needed and determine the moles of Cl - present in your solution.
b. Determine the moles of $\mathrm{Pb}^{+2}$ ion present in the final solution.
c. Calculate $\mathrm{K}_{\text {sp. }}$. (Note: You must use diluted concentrations of ions in mol/L)
d. Why did the $\mathrm{PbCl}_{2}$ not precipitate immediately on addition of HCl ?
2. Observing the effect of temperature on the system can determine the sign of enthalpy for this reaction.
a. Place the test tube in hot water and record your observations.
b. Place the test tube in cold water and record your observations.
c. What is the sign of $\Delta \mathrm{H}$ for the above reaction? Explain.
d. What happened to the value of $\mathrm{K}_{\mathrm{sp}}$ in the hot solution? (Increase, decrease, no change) Explain.
3. Add deionized water to the test tube in 0.5 mL increments, stirring well after each addition.
a. Record the volume of water added when the precipitate just dissolves.
b. Calculate the molar concentration of $\mathrm{Pb}^{+2}$ and $\mathrm{Cl}^{-1}$ ions and your reactant quotient $(\mathrm{Q})$.
c. Explain why the $\mathrm{PbCl}_{2}$ dissolved in water.

## Part B: Complex Ion Equilibria

Many metallic ions exist as complex ions in solution, combining with other ions or molecules called ligands. While complex ions are stable, they may be converted to other complex ions by the addition of ligands that form more stable complexes. Common ligands include $\mathrm{OH}^{-}, \mathrm{NH}_{3}$, and $\mathrm{Cl}^{-}$, etc. In this section the cobalt (II) ion can exist as either the pink complex ion $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}+2(\mathrm{aq})$ or the blue complex ion $\mathrm{CoCl}_{4}^{-2}(\mathrm{aq})$ depending on the conditions. The principles of equilibrium can be used to predict which ion will be present.

$$
\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6^{+2}}(\mathrm{aq}, \mathrm{pink})+4 \mathrm{Cl}(\mathrm{aq}) \rightleftharpoons \mathrm{CoCl}_{4}^{-2}(\mathrm{aq}, \text { blue })+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

1. Place a few crystals of $\mathrm{CoCl}_{2}-6 \mathrm{H}_{2} \mathrm{O}$ in a regular test tube. Record the color and determine the Co (II) complex ion present in solution for each of the following. Explain.
a. Add $2 \mathrm{~mL}(40$ drops $)$ of 12 M HCl (CAUTION) and stir to dissolve the crystals.
b. Add 2 mL increments of deionized $\mathrm{H}_{2} \mathrm{O}$ to the test tube until no further color change occurs.
c. Place the sample in hot water and cold water and record the color change. What is the sign of $\Delta \mathrm{H}$ for the above equation? Explain.

## Part C: Acid-Base Indicators

Acid-base indicators are chemical substances which change color in solution when $\left[\mathrm{H}^{+}\right]$changes. Methyl violet (HMV) is an example of an acid-base indicator. In solution, HMV dissociates as follows:

$$
\mathbf{H M V}(\mathrm{aq}, \text { yellow }) \rightleftharpoons \mathbf{H}^{+}(\mathrm{aq})+\mathbf{M V}-(\mathrm{aq}, \text { violet })
$$

In solution, HMV has an intense yellow color while MV- is violet. Therefore, a change in $\left[\mathrm{H}^{+}\right]$will affect the color of the indicator solution.

1. Add 5 mL of deionized $\mathrm{H}_{2} \mathrm{O}$ to a test tube. Add a few drops of methyl violet indicator. Record the color.
2. What reagent could be added to shift the equilibrium (change color)? Design and test your hypothesis to demonstrate this equilibrium shift. Explain your results.
3. What reagent could be added to shift the equilibrium back to its original color? Design and test this hypothesis. Explain your results.

## Part D: Dissolving Insoluble Solids

Not all solids will dissolve by adding more water or heating the solution. However, in these cases we can employ the principles of equilibrium to dissolve solids. We will use $\mathrm{Zn}(\mathrm{OH})_{2}$ as an example:

$$
\mathbf{Z n}(\mathbf{O H})_{2}(\mathbf{s}) \rightleftharpoons \mathbf{Z n}^{+2}(\mathbf{a q})+\mathbf{2} \mathbf{O H}-(\mathbf{a q}) \text { where } \mathbf{K}_{\text {sp }}=\left[\mathbf{Z n}^{+2}\right]\left[\mathrm{OH}^{-}\right]^{2}=\mathbf{5} \times 10^{-17}
$$

The equilibrium constant for this dissociation is quite small, indicating that the reaction does not go very far to the right. Thus, $\mathrm{Zn}(\mathrm{OH})_{2}$ is virtually insoluble in water. In a saturated solution, $\left[\mathrm{Zn}^{+2}\right] \mathrm{x}\left[\mathrm{OH}^{-}\right]^{2}$ must equal 5 x $10^{-17}$. However, if this product is somehow lowered to less than $5 \times 10^{-17}$, then $\mathrm{Zn}(\mathrm{OH})_{2}$ will dissolve until the products equal $\mathrm{K}_{\mathrm{sp}}$, where equilibrium will again be obtained. To do this, the concentration of one of the products must be lowered rather drastically. Using a second equilibrium present in solution:

$$
\mathbf{H}^{+}(\mathbf{a q})+\mathbf{O H}(\mathbf{a q}) \rightleftharpoons \mathbf{H}_{2} \mathbf{O}(\mathbf{l})
$$

the addition of an acid to the solution will increase $\left[\mathrm{H}^{+}\right]$and thereby lower [ $\left.\mathrm{OH}^{-}\right]$. This in turn will drive the above reaction to the right, dissolving $\mathrm{Zn}(\mathrm{OH})_{2}$.

Alternatively, we can lower the concentration of $\mathrm{Zn}^{+2}$ ion by taking advantage of the fact that zinc ion forms stable complex ions with $\mathrm{OH}^{-}$and $\mathrm{NH}_{3}$ :

$$
\begin{array}{ll}
\mathbf{Z n}^{+2}(\mathrm{aq})+4 \mathbf{O H}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Zn}(\mathrm{OH})_{4^{-2}}(\mathrm{aq}) & \mathrm{K}_{1}=\mathbf{3} \times 10^{15} \\
\mathbf{Z n}^{+2}(\mathrm{aq})+4 \mathrm{NH}_{3}(\mathrm{aq}) \rightleftharpoons \mathbf{Z n}\left(\mathrm{NH}_{3}\right) 4^{+2}(\mathrm{aq}) & \mathrm{K}_{2}=\mathbf{1} \times 10^{9}
\end{array}
$$

In high concentrations of $\mathrm{OH}^{-}$or $\mathrm{NH}_{3}$, the above reactions are driven to the right, lowering $\left[\mathrm{Zn}^{+2}\right]$.

1. To each of three small test tubes, add about $2 \mathrm{~mL} 0.1 \mathrm{M} \mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$. Add one drop 6 M NaOH to each test tube and stir. Record your observations.
a. To the first test tube add 6 M HCl drop by drop. Record and explain your observations.
b. To the second test tube add 6 M NaOH drop by drop. Stir well and explain your observations.
c. To the third test tube add $6 \mathrm{M} \mathrm{NH}_{3}$ (or $\mathrm{NH}_{4} \mathrm{OH}$ ) drop by drop. Stir well and explain your observations.
2. Repeat the above procedure using 2 mL of $0.1 \mathrm{M} \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ instead of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ in three separate test tubes. Add one drop of 6 M NaOH to each test tube and stir. Record your observations.
a. Use the same volume of HCl as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
b. Use the same volume of 6 M NaOH as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
c. Use the same volume of $6 \mathrm{M} \mathrm{NH}_{3}$ (or $\mathrm{NH}_{4} \mathrm{OH}$ ) as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
3. Explain the following in your report:
a. What insoluble hydroxide formed when one drop of NaOH was added to the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ ? To the $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ ?
b. Explain why some of the reactions were similar between the two metal ions and why some were different.
c. Why does an insoluble hydroxide tend to dissolve in acidic solution?
d. Does $\mathrm{Mg}^{+2}$ ion appear to form complex ions with $\mathrm{OH}^{-}$and $\mathrm{NH}_{3}$ ? Explain.

## This page left blank for printing purposes

## Le Chatelier's Principle

YOUR NAME: $\qquad$ LAB PARTNER(s):

Purpose: To explore Le Chatelier's Principle through four different chemical scenarios. Follow the instructions and learn about Le Chatelier's Principle!

## Goal \#1: Part A: Solubility Equilibrium: Finding a value for Ksp

1. Set up a hot water bath using a 400 mL beaker for step 2 below. To a (room temperature) test tube, add $\mathbf{5 . 0}$ $\mathbf{m L} 0.30 \mathrm{M} \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$. Add $\mathbf{0 . 3 0} \mathbf{M ~ H C l}$ in $\mathbf{0 . 5} \mathbf{m L}$ increments ( $\mathbf{1 0} \mathbf{d r o p s )}$ to the $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ until a white precipitate forms.

How many mL of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ were used? $\qquad$ mL

How many mL of HCl did you use? $\qquad$ mL

Total volume of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and $\mathrm{HCl}=$ $\qquad$ mL (add up two previous volumes)

Calculate the moles of $\mathrm{Pb}^{2+}$ added to the solution: $\qquad$ moles

Calculate the moles of $\mathrm{Cl}^{-1}$ added to the solution: $\qquad$ moles

Calculate the concentration (M) of $\mathrm{Pb}^{2+}$ at equilibrium: $\qquad$ M (use total volume!)

Calculate the concentration (M) of $\mathrm{Cl}^{-1}$ at equilibrium: $\qquad$ M (use total volume!)

Calculate the value of $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Cl}^{-1}\right]^{2} \mathrm{~K}_{\mathrm{sp}}=$ $\qquad$
Remember: $\left[\mathrm{Pb}^{2+}\right]=\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{M})$ and $\left[\mathrm{Cl}^{-1}\right]=\mathrm{HCl}(\mathrm{M})$. Show work!

## Goal \#1: Part A continued

2. Observing the effect of temperature on the system can determine the sign of enthalpy for this reaction.

* Place the test tube in hot water and record your observations. What happened to the solid $\mathrm{PbCl}_{2}$ as it was heated up?
* Place the test tube in cold water and record your observations. What happened to the $\mathrm{PbCl}_{2}$ solution as it was cooled down?
> * Remembering that $\mathrm{K}_{\text {sp }}$ is defined here as: $\mathbf{P b C l}_{\mathbf{2}}(\mathbf{s}) \rightleftharpoons \mathbf{P b}^{\mathbf{2}}(\mathbf{a q})+\mathbf{2} \mathbf{C l}^{\mathbf{- 1}}(\mathbf{a q})$, is this reaction endothermic or exothermic? Explain.

3. Add deionized water to the test tube in 0.5 mL increments, stirring well after each addition

How much water did you add to the solution to make the $\mathrm{PbCl}_{2}(\mathrm{~s})$ disappear? $\qquad$ mL

Calculate the value of $\mathrm{Q}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Cl}^{-1}\right]^{2} \mathrm{Q}=$ $\qquad$ Show work!

Hint: use moles of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and HCl from the previous page, divide each by the total volume (which includes the water added in the previous question) to find $\left[\mathrm{Pb}^{2+}\right]$ and $\left[\mathrm{Cl}^{-1}\right]$, then calculate $Q$.

## Goal \#2: Part B: Complex Ion Equilibria

1. Place a few crystals of $\mathrm{CoCl}_{2}-6 \mathrm{H}_{2} \mathrm{O}$ in a regular test tube. Record the color and determine the Co (II) complex ion ("pink" or "blue" will be fine) present in solution for each of the following.

* Add 2 mL ( 40 drops) of 12 M HCl (CAUTION) and stir to dissolve the crystals.

When HCl was added to the crystals, what color was observed? (circle one) Pink Blue

* Add 2 mL increments of deionized $\mathrm{H}_{2} \mathrm{O}$ to the test tube until no further color change occurs.

When water was added to the solution, what color was observed? (circle one) Pink Blue

* Place the sample in hot water and cold water and record the color change.

Explain what happened when the sample was added to hot water and cold water:

Is this reaction endothermic (positive $\Delta H$ ) or exothermic (negative $\Delta H$ )? Explain.

## Goal \#3: Part C: Acid-Base Indicators

1. Add 5 mL of deionized $\mathrm{H}_{2} \mathrm{O}$ to a test tube. Add a few drops of methyl violet indicator.

When drops of methyl violet are added to water, what color is observed? Yellow Violet (circle one)

What chemical (reagent) can be used to change the color of the solution? Add the chemical and state what chemical you used. (hint: this is an acid-base indicator.)

What chemical (reagent) can be used to change the color of the solution back to the original color? Add the chemical to observe the change; state what chemical you used. Explain why adding this reagent worked.

## Goal \#4: Part D: Dissolving Insoluble Solids - the Zinc Test

1. To each of three small test tubes, add about $2 \mathrm{~mL} 0.1 \mathrm{M} \mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$. Add one drop 6 M NaOH to each test tube and stir.

When one drop of NaOH was added to each of the three Zn -containing test tubes, what was observed? Explain why this happened and identity the white solid.

* To the first test tube add 6 M HCl drop by drop. Record and explain your observations.

Explain what happened when HCl was added to the first white solid-containing test tube. Do acids appear to dissolve insoluble hydroxides?

* To the second test tube add 6 M NaOH drop by drop. Stir well and explain your observations.

Explain what happens when excess NaOH is added to the second white solid-containing test tube. Do you think that the complex ion $\left(\mathbf{Z n}(\mathbf{O H})_{4}{ }^{-2}(\mathbf{a q})\right)$ could have formed? Explain.

* To the third test tube add $6 \mathrm{M} \mathrm{NH}_{3}$ (or $\mathrm{NH}_{4} \mathrm{OH}$ ) drop by drop. Stir well and explain your observations.

Explain what happens when $\mathrm{NH}_{3}$ is added to the third white solid-containing test tube. Do you think that the complex ion $\left.\left(\mathbf{Z n}\left(\mathbf{N H}_{3}\right)_{4}{ }^{+2} \mathbf{( a q}\right)\right)$ could have formed? Explain.

## Goal \#4: Part D: Dissolving Insoluble Solids - the Magnesium Test

2. Repeat the above procedure using 2 mL of $0.1 \mathrm{M} \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ instead of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ in three separate test tubes. Add one drop of 6 M NaOH to each test tube and stir.

When one drop of NaOH is added to each of the three Mg-containing test tubes, what is observed? Explain why this happened and identity the white solid.

* Use the same volume of HCl as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.

Explain what happened when HCl was added to the first white solid-containing test tube. Do acids appear to dissolve insoluble hydroxides?

* Use the same volume of 6 M NaOH as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.

Explain what happened when excess NaOH was added to the second white solid-containing test tube. Do you think that a complex ion could have formed? Explain.

* Use the same volume of $6 \mathrm{M} \mathrm{NH}_{3}$ (or $\left.\mathrm{NH}_{4} \mathrm{OH}\right)$ as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.

Explain what happened when $\mathrm{NH}_{3}$ was added to the third white solid-containing test tube. Do you think that a complex ion could have formed? Explain.

In terms of electron orbitals, what differences can be found between zinc and magnesium?

Do complex ions appear to form easier with main group metals or transition metals? Why?

## Postlab Questions:

1. Methyl orange (HMO) is a common acid-base indicator. In solution it ionizes according to the equation:
$\mathbf{H M O}(\mathrm{aq}, \mathrm{red}) \rightleftharpoons \mathrm{H}^{+}(\mathrm{aq})+\mathrm{MO}^{-}(\mathrm{aq}$, yellow $)$
Chat adds 5 mL of deionized water to a test tube and adds 5 drops of methyl orange. He is captivated by the lovely yellow color of the solution.
a. If Chat adds 6 M HCl to his solution, what color will he observe? Explain.
b. If Chat next adds 6 M NaOH to the solution, what color will be observed? Explain.
2. Zinc hydroxide is relatively insoluble in water. The reaction is represented as:
$\mathbf{Z n}(\mathbf{O H})_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Zn}^{+2}(\mathrm{aq})+2 \mathbf{O H}^{-}(\mathrm{aq})$
a. What is the equilibrium expression for the above reaction?
b. For $\mathrm{Zn}(\mathrm{OH})_{2}$ to be soluble in solution, $\left[\mathrm{Zn}^{+2}\right]$ or $\left[\mathrm{OH}^{-}\right]$must be relatively small. Explain.
c. Would you expect $\mathrm{Zn}(\mathrm{OH})_{2}$ to dissolve if acid were added to the solution? Explain.

# CH 223 Spring 2024: <br> "Titration Calculations (in class)" Lab - Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/4b.htm
Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-4-2 through Ia-4-25 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2 -point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, April 15 (section 01) or Wednesday, April 17 (section H1.) You will need to create and submit four computer generated graphs with this report, plus you need to submit additional page(s) showing detailed calculations of your work for this lab. Include your name on page I-4-25!

Step Three:
Complete the lab work and calculations on your own, then turn it in your lab (page Ia-4-25 plus the graphs and work page(s) only to avoid a point penalty) at the beginning of recitation to the instructor on Monday, April 22 (section 01) or Wednesday, April 24 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Acid and Base Titrations - Equation Guide

Strong Acid + Strong Base: $(S A+S B)$

Initial Region:

$$
\mathbf{p H}=-\log \left(\mathbf{n}_{\mathrm{sa}} / V_{\mathrm{sa}}\right)
$$

Pre-Equivalence Region: $\quad \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

$$
\text { or } \mathbf{p H}=-\log \left(\mathbf{C}_{\mathrm{sa}}\right)
$$

or $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{\text {total }}}\right)$
Equivalence:

$$
\mathbf{p H}=7
$$

Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$ or $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{\text {total }}}\right)$

Strong Base + Strong Acid: $(S B+S A)$

Initial Region:

$$
\mathbf{p H}=14+\log \left(\mathbf{n}_{\mathbf{s b}} / \mathbf{V}_{\mathrm{sb}}\right)
$$

or $\mathbf{p H}=14+\log \left(\mathbf{C}_{\mathbf{s b}}\right)$
Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
or $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{\text {total }}}\right)$
Equivalence:
$\mathbf{p H}=7$
Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

$$
\text { or } \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{\text {total }}}\right)
$$

Weak Acid + Strong Base: $(W A+S B)$
Initial Region:

$$
\mathbf{p H}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}} \quad \text { or } \mathbf{p H}=-\log \sqrt{K_{a} \cdot C_{w a}}
$$

Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)$
Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K} \mathbf{a}$

Equivalence:

$$
\left.\begin{array}{l}
\text { Equivalence: } \quad \mathbf{p H}=\mathbf{1 4}+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}
\end{array} \text { or } \mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot C_{w b}}\right)
$$

Continued on next page

Initial Region: $\quad \mathbf{p H}=\mathbf{1 4}+\log ^{K_{b} \cdot \frac{n_{w b}}{V_{w b}}} \quad$ or $\mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot C_{w b}}$
Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)$
Half-Equivalence Region: $\quad \mathbf{p H}=\mathbf{p K}_{\mathbf{a}}$
Equivalence:
Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right) \quad$ or $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{t o t a l}}\right)$

## Guide to Symbols

$$
\begin{aligned}
& \mathbf{n}=\text { moles } \\
& \mathbf{V}=\text { volume }(\mathrm{L}) \\
& \mathbf{C}=\text { concentration }(\mathrm{M} \text { or } \mathrm{mol} / \mathrm{L}) \\
& \mathbf{s a}=\text { strong acid } \\
& \mathbf{s b}=\text { strong base } \\
& \mathbf{w a}=\text { weak acid } \\
& \mathbf{w b}=\text { weak base }
\end{aligned}
$$

$\mathbf{K}_{\mathbf{a}}=$ acid dissociation constant for a weak acid
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}$
$K_{a}=10-\mathrm{pKa}$
$\mathbf{K}_{\mathbf{b}}=$ base dissociation constant for a weak base
$\mathbf{p} K_{b}=-\log K_{b}$
$K_{b}=10-\mathrm{pKb}$
$\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}=$ autoionization constant for water at $25^{\circ} \mathrm{C}$
Also, $\mathbf{K}_{\mathbf{w}}=\left[\mathbf{H}_{\mathbf{3}} \mathbf{O}^{+}\right] *\left[\mathrm{OH}^{-}\right]=\mathbf{K}_{\mathbf{a}} * \mathbf{K}_{\mathbf{b}}=\mathbf{1 0}^{-14}$
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
$\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$
$14=\mathbf{p H}+\mathbf{p O H}=\mathbf{p K}_{\mathbf{a}}+\mathrm{pK}_{\mathbf{b}}$

## Strong Acid + Strong Base Titration - Overview

Initial:
$\mathrm{pH}=-\log \left[\mathrm{n}_{\mathrm{sa}} / \mathrm{V}_{\mathrm{sa}}\right]$
Pre-equivalence: $\quad \mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right)$
Equivalence:
$\mathrm{pH}=7$ (neutral salt + water)
Post-equivalence: $\mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{sa}}}\right)$

## Strong Base + Strong Acid Titration - Overview

Initial:
Pre-equivalence:
Equivalence:
Post-equivalence: $\mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right)$

## Weak Acid + Strong Base Titration - Overview

Initial:

$$
\mathrm{pH}=-\log \sqrt{\mathrm{K}_{\mathrm{a}} \mathrm{C}_{\mathrm{wa}}}
$$

Pre-equivalence:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}\right)
$$

Equivalence:

$$
\mathrm{pH}=14+\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{a}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{wa}}+\mathrm{V}_{\mathrm{sb}}}\right)}
$$

$$
\text { Post-equivalence: } \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{wa}}}\right)
$$

## Weak Base + Strong Acid Titration - Overview

Initial:
Pre-equivalence:

$$
\begin{aligned}
& \mathrm{pH}=14+\log \sqrt{\mathrm{K}_{\mathrm{b}} \mathrm{C}_{\mathrm{wb}}} \\
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{n}_{\mathrm{sa}}}\right)
\end{aligned}
$$

Equivalence:

$$
\mathrm{pH}=-\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{b}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wb}}}{\mathrm{~V}_{\mathrm{wb}}+\mathrm{V}_{\mathrm{sa}}}\right)}
$$

Post-equivalence:
$\mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{wb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{wb}}}\right)$

## CH 223 Guide to Acid and Base Titration Calculations

Acid and base titrations can be a challenging concept for students to conquer in CH 223 . This handout will help prepare you for the types of problems associated with titrations.

A titration is an experimental procedure whereby a solution (usually either acidic or basic) is added dropwise to a second solution (usually either acidic or basic.) One solution will be acidic while the other will be basic. The solution that is added dropwise is called the titrant. Titrations are often graphed using $\mathbf{p H}$ as the y -axis and Volume of Titrant ( mL ) as the x -axis. Sometimes a second y -axis is used to plot the first derivative; we shall explore this concept in the labs during CH 223.
pH is defined as the negative $\log$ of the hydronium concentration, i.e. $\mathbf{p H}=-\boldsymbol{\operatorname { l o g }}\left[\mathbf{H}_{3} \mathbf{O}^{+}\right]$. All of the calculations given below reflect this basic idea. Values of pH less than seven indicate acidic conditions, while pH values greater than seven indicate basic conditions; a pH reading of 7 is neutral (neither acidic nor basic). Weak acids, weak bases, strong acids and strong bases require different formulas to find the concentration of $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$; hence, there are different mathematical approaches to titrations depending on the substituents being titrated. We shall concern ourselves only with monoprotic acids and bases - those that have only one equivalent of $\mathrm{H}_{3} \mathrm{O}^{+}$or OH - to offer.

We will study four monoprotic titration combinations:

- Strong acid titrated with strong base: the pH is initially acidic but becomes more basic as the strong base titrant is added
- Strong base titrated with strong acid: the pH is initially basic but becomes more acidic as the strong acid titrant is added
- Weak acid titrated with strong base: the pH is initially somewhat acidic but becomes more basic as the strong base titrant is added
- Weak base titrated with strong acid: the pH is initially somewhat basic but becomes more acidic as the strong acid titrant is added

Weak acid + weak base titration combinations require an intensive analysis of $\mathrm{K}_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ constants and are of limited versatility; hence, we will cover only the first four types of titrations.

Before you begin calculations for any titration in CH 223, do the following:

1) Determine if solution to be titrated contains an acid or a base, and determine if it is strong or weak.
2) Determine if the titrant is an acid or base and if it is weak or strong
3) If the solution contains a weak acid, find the $\mathbf{K}_{\mathbf{a}}$; if a weak base, find $\mathbf{K}_{\mathbf{b}}$.
4) Refer to the appropriate section:

- Strong Acid (solution) titrated with a Strong Base: Section One
- Strong Base (solution) titrated with a Strong Acid: Section Two
- Weak Acid (solution) titrated with a Strong Base: Section Three
- Weak Base (solution) titrated with a Strong Acid: Section Four

Notes: Weak acids with weak bases and weak bases with weak acids will not be covered in CH 223.
Polyprotic acid and base titrations will not be mathematically covered in CH 223 Redox titrations will be covered in the subsequent electrochemistry chapter. Additional information on pH calculations can be found in the Web-only handout "A Closer Look at Titrations" available on the CH 223 website

## Section One: Strong Acid + Strong Base (SA + SB) Titration <br> Equivalence Point $\mathbf{p H}=\mathbf{7}$ neutral

## Before you begin:

Strong acids titrated with strong bases will neutralize each other at the equivalence point. Therefore, you should expect to see a neutral pH when the quantity of acid equals the quantity of base added.

## Determine the following quantities:

$\mathbf{V}_{\mathrm{sa}}=$ volume of strong acid initially present
$\mathbf{n}_{\mathrm{sa}}=$ moles of strong acid $\left(=\mathrm{C}_{\mathrm{sa}} * \mathrm{~V}_{\mathrm{sa}}\right)$
$\mathbf{C}_{\text {sb }}=$ concentration of strong base
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base to reach equivalence point ( $=\mathrm{n}_{\mathrm{sa}} / \mathrm{C}_{\mathrm{sb}}$ )

## Analysis Section:

There are four regions in $\mathrm{SA}+\mathrm{SB}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=-\log \left(\mathbf{n}_{\mathrm{sa}} / \mathbf{V}_{\mathrm{sa}}\right)$

The pH will reflect the strong acid only - no strong base has been added.

- Pre-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the remaining acid in solution after some neutralization with strong base. $\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{sb}}$ in this region.

- Equivalence: $\mathbf{p H}=\mathbf{7}$
$\mathrm{n}_{\mathrm{sa}}=\mathrm{n}_{\mathrm{s} \text { b }}$, so water and a neutral salt will be produced at this point.
- Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the excess base remaining after neutralizing the strong acid.
$\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{sa}}$ in this region.
Example: $\quad$ Titrate 50.0 mL of $0.200 \mathrm{M} \mathrm{HNO}_{3}$ with 0.100 M NaOH . Determine the pH after $0.00,10.0$, 100 . and 150 . mL of NaOH has been added.
$\mathrm{HNO}_{3}$ is a strong acid, NaOH is a strong base; the equivalence point $\mathrm{pH}=7$
$\mathbf{V}_{\mathrm{sa}}=50.0 \mathrm{~mL}=0.0500 \mathrm{~L}$
$\mathbf{n}_{\text {sa }}=0.200 \mathrm{M} * 0.0500 \mathrm{~L}=\mathbf{0 . 0 1 0 0} \mathbf{~ m o l}$
$\mathrm{C}_{\mathrm{sb}}=\mathbf{0 . 1 0 0 ~ M}$
$\mathbf{V}_{\text {sb }}=0.0100 \mathrm{~mol} / 0.100 \mathrm{M}=0.100 \mathrm{~L}=\mathbf{1 0 0}$. $\mathbf{m L} \mathbf{N a O H}$ to the equivalence point
At 0.00 mL : Initial point: $\mathrm{pH}=-\log \left(\mathrm{n}_{\mathrm{sa}} / \mathrm{V}_{\mathrm{sa}}\right)=-\log (0.0100 \mathrm{~mol} / 0.0500 \mathrm{~L})=\mathbf{0 . 7 0}$
The pH reflects only the strong acid; no strong base has been added at this point.

At $10.0 \mathrm{~mL}: \quad$ Pre-equivalence point: $\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$
At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 1 0 0} \mathrm{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0100 \mathrm{~L}^{*} 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$

$$
\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)=-\log \left(\frac{0.0100-0.00100}{0.0500+0.0100}\right)=\mathbf{0 . 8 2}
$$

Note: $10.0 \mathrm{~mL}<100 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At 100. mL : $\quad$ Equivalence point, $\mathbf{p H}=\mathbf{7}$
At $100.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.100 \mathrm{~L} * 0.100 \mathrm{M}=0.0100 \mathrm{~mol}=\mathrm{n}_{\mathrm{sa}}$
Equal molar quantities of acid and base have been added; therefore,

$$
\mathrm{HNO}_{3}+\mathrm{NaOH} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NaNO}_{3}
$$

$\mathrm{NaNO}_{3}$ is a neutral salt, and the pH of water is 7 ; therefore, the equivalence pH is 7 .
At 150. $m L: \quad$ Post-equivalence point: $\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
At $150.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.150 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 1 5 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{sa}}$. This point lies in the postequivalence region, so:

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)=\mathbf{1 4}+\log \left(\frac{0.0150-0.0100}{0.150+0.0500}\right)=\mathbf{1 2 . 4 0}
$$

The titration graph for a strong acid + strong base would look like this:

Notice the sharp slope around the equivalence point region - this is indicative of strong acid + strong base titrations. Note that the equivalence point pH is $7.0-$ this is also what we would expect for this type of titration. Knowing how to predict the type of titration from a graph can be of considerable assistance to you in CH 223.

## Section Two: Strong Base + Strong Acid (SB + SA) Titration Equivalence Point $\mathbf{p H}=\mathbf{7}$ neutral

Analysis of this type of titration is very similar to the analysis for a Strong Acid + Strong Base (Section 1, above) except that the strong base will be dominant initially, followed by a slow erosion with a strong acid. Notice the subtle changes to the equations in this section when compared to section 1 ; you should see a pattern developing which can help you in your calculations.

## Before you begin:

As in section 1, strong bases titrated with strong acids will neutralize each other at the equivalence point. Therefore, you should expect to see a neutral pH when the quantity of base equals the quantity of acid added.

Determine the following quantities:
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base initially present
$\mathbf{n}_{\mathbf{s b}}=$ moles of strong base ( $=\mathrm{C}_{\mathrm{sb}} * \mathrm{~V}_{\mathrm{sb}}$ )
$\mathbf{C}_{\mathrm{sa}}=$ concentration of strong acid
$\mathbf{V}_{\mathrm{sa}}=$ volume of strong acid to reach equivalence point $\left(=\mathrm{n}_{\mathrm{sb}} / \mathrm{C}_{\mathrm{sa}}\right)$

## Analysis Section:

There are four regions in $\mathrm{SB}+\mathrm{SA}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\mathbf{n}_{\text {sb }} / \mathbf{V}_{\mathbf{s b}}\right)$

The pH will reflect the strong base only - no strong acid has been added.
Note the presence of " 14 " in the equation; this is due to the fact that:

$$
\begin{gathered}
\mathrm{pOH}=-\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right) \\
\text { and } \\
14=\mathrm{pH}+\mathrm{pOH}
\end{gathered}
$$

Combining these equations and solving for pH gives $\mathrm{pH}=14+\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right)$.

- Pre-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the remaining base in solution after some neutralization with strong acid. $\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{sa}}$ in this region.

- Equivalence: $\mathbf{p H}=\mathbf{7}$
$\mathrm{n}_{\mathrm{sb}}=\mathrm{n}_{\mathrm{sa}}$, so water and a neutral salt will be produced at this point.
- Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the excess acid remaining after neutralizing the strong base.
$\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{sb}}$ in this region.

Example: $\quad$ Titrate $100 . \mathrm{mL}$ of 0.500 M NaOH with 1.00 M HCl . Determine the pH after $0.00,25.0$, 50.0 and 80.0 mL of NaOH has been added.

NaOH is a strong base, HCl is a strong acid; the equivalence point $\mathrm{pH}=7$
$\mathbf{V}_{\mathbf{s b}}=100 . \mathrm{mL}=\mathbf{0 . 1 0 0} \mathrm{L}$
$\mathbf{n}_{\mathbf{s b}}=0.500 \mathrm{M} * 0.100 \mathrm{~L}=\mathbf{0 . 0 5 0 0} \mathbf{~ m o l}$
$\mathrm{C}_{\mathrm{sa}}=\mathbf{1 . 0 0} \mathrm{M}$
$\mathbf{V}_{\mathbf{s a}}=0.0500 \mathrm{~mol} / 1.00 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ H C l}$ to the equivalence point
At $0.00 \mathrm{~mL}: \quad$ Initial point: $\mathrm{pH}=14+\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right)=14+\log (0.0500 \mathrm{~mol} / 0.100 \mathrm{~L})=\mathbf{1 3 . 7 0}$
The pH reflects only the strong base; no strong acid has been added at this point.
At 25.0 mL : Pre-equivalence point: $\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
At $25.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sa}}=\mathbf{0 . 0 2 5 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sa}}=0.0250 \mathrm{~L} * 1.00 \mathrm{M}=\mathbf{0 . 0 2 5 0} \mathbf{~ m o l}$

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)=\mathbf{1 4}+\log \left(\frac{0.0500-0.0250}{0.100+0.0250}\right)=\mathbf{1 3 . 3 0}
$$

Note: $25.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
Notice how there is little pH change upon adding this much acid. Strong base + strong acid pH curves change slowly until the equivalence point is reached, then the change becomes quite noticeable.

At 50.0 mL : $\quad$ Equivalence point, $\mathbf{p H}=\mathbf{7}$
At $50.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0500 \mathrm{~L} * 1.00 \mathrm{M}=0.0500 \mathrm{~mol}=\mathrm{n}_{\mathrm{sb}}$
Equal molar quantities of base and acid have been added; therefore,

$$
\mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NaCl}
$$

NaCl is a neutral salt, and the pH of water is 7 ; therefore, the equivalence pH is 7 .
At $80.0 \mathrm{~mL}: \quad$ Post-equivalence point: $\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$
At $80.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0800 \mathrm{~L}^{*} 1.00 \mathrm{M}=\mathbf{0 . 0 8 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{sb}}$. This point lies in the postequivalence region, so:

$$
\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)=-\log \left(\frac{0.0800-0.0500}{0.0800+0.100}\right)=\mathbf{0 . 7 8}
$$

Notice how the pH changed rapidly between 25.0 mL of acid added (still quite basic) and 80.0 mL of acid added (where the pH is quite acidic). As the concentration of strong acids and bases increases, the titration curves will show a steeper equivalence point.

The titration graph for a strong base + strong acid would look like this:

As in section 1, notice the sharp slope around the equivalence point region - this is indicative of strong base + strong acid titrations. Note that the equivalence point pH is 7.0 - this is also what we would expect for this type of titration. At first, the NaOH dominated the titration, and the graph pH was quite basic. At the conclusion of the titration, HCl dominated and overcame the NaOH present in solution, and the pH became quite acidic. Remembering simple facts can aid your analysis of titrations in CH 223.

## Section Three: Weak Acid + Strong Base (WA + SB) Titration Equivalence Point pH $>\mathbf{7}$ basic

Weak acids and weak bases have incomplete ionization in solution, which is in marked contrast to their strong acid and strong base counterparts. For example, if we have a solution of 1.00 M HCl in water,

$$
\mathrm{HCl}_{(\mathrm{aq})} \rightarrow \mathrm{H}_{(\mathrm{aq})}^{+}+\mathrm{Cl}_{-(\mathrm{aq})}
$$

we would have $100 \%$ of the $\mathrm{HCl}_{(\mathrm{aq})}$ converted to $\mathrm{H}^{+}(\mathrm{aq})$ and $\mathrm{Cl}^{-(\mathrm{aq})}$; no HCl would remain in solution.
If we had a solution of $1.00 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ in water,

$$
\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2(\mathrm{aq})} \rightleftharpoons \mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-1}{ }_{(\mathrm{aq})}
$$

we would have roughly $99 \%$ of the $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ still present in solution; less than $1 \%$ of the $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2(\mathrm{aq})}$ would ionize into $\mathrm{H}^{+}{ }_{(\text {aq) }}$ and $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{-}(\mathrm{aq})$. Weak acids and weak bases do not ionize completely in solution. Recall that if $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ is our weak acid, $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2^{-}}$(aq) will be the conjugate base in this system. Strong acids and bases do not have effective conjugate acids or bases.

To account for the discrepancy in ionization behavior, we will use the acid equilibrium constant, $\mathbf{K}_{\mathrm{a}}$, and the base equilibrium constant, $\mathbf{K}_{\mathbf{b}}$, in our calculations. Recall that $\mathrm{K}_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ are related to $\mathbf{K}_{\mathbf{w}}$, the autoionization of water constant, by the following expression:

$$
\mathrm{K}_{\mathrm{w}}=\mathrm{K}_{\mathrm{a}} * \mathrm{~K}_{\mathrm{b}}
$$

To speed our calculations when the weak acid or weak base is present in excess, we can use the Henderson-Hasselbalch equation. We will use a slightly modified form in this section, but the generic equation is:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { CConj. base }\rfloor}{[\text { acid }]}
$$

where $\quad \mathrm{pH}=\mathrm{pH}$ of system
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log ($ acid dissociation constant for weak acid in buffer $)$
[Conj. base] = concentration or moles of base in solution
[acid] = concentration or moles of weak acid in solution
The Henderson-Hasselbalch equation tells us that when the moles of the strong base added equal onehalf the moles of weak acid initially present (i.e. ${ }^{1 / 2} n_{w a}=n_{\text {sb }}$ ), a special condition occurs; this point is called the half-equivalence point, and $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}$ here. Therefore, we need to add an additional region to our calculations, the half-equivalence region.

Before you begin: Determine the following quantities:
$\mathbf{V}_{\mathbf{w a}}=$ volume of weak acid initially present
$\mathbf{n}_{\mathrm{wa}}=$ moles of weak acid $\left(=\mathrm{C}_{\mathrm{wa}} * \mathrm{~V}_{\mathrm{wa}}\right)$
$\mathbf{K}_{\mathbf{a}}=$ acid dissociation constant for the weak acid
$\mathbf{p} \mathbf{K}_{\mathbf{a}}=-\log \mathrm{K}_{\mathbf{a}}$ (this is a just a unitless number)
$\mathbf{C}_{\mathbf{s b}}=$ concentration of strong base
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base to reach equivalence point ( $=\mathrm{n}_{\mathrm{wa}} / \mathrm{C}_{\mathrm{sb}}$ )
Also remember that at room temperature, $\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}$

Analysis Section: There are five regions in WA +SB titrations in which to calculate the pH :

- Initial Region: $\mathbf{p H}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}$

The pH will reflect the weak acid only - no strong base has been added. Recall that for weak acids,

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} \cdot C_{w a}}
$$

and $\mathrm{C}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{wa}} / \mathrm{V}_{\mathrm{wa}}$, just as $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$.

- Pre-Equivalence Region: $\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)$

Because $\mathrm{n}_{\mathrm{wa}}>\mathrm{n}_{\mathrm{sb}}$ in this region, the pH will be affected by two factors: 1 ) the remaining weak acid in the solution, and 2) the conjugate base present upon addition of strong base. For weak acids HA reacting with strong base NaOH ,

$$
\mathrm{HA}+\mathrm{NaOH} \rightarrow \mathrm{HOH}+\mathrm{Na}^{+}+\mathrm{A}^{-}
$$

The species A- is the conjugate base of the weak acid HA, and it will react with water to re-form the weak acid:

$$
\mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HA}+\mathrm{OH}^{-}
$$

The generation of $\mathrm{OH}^{-}$from the conjugate base will affect pH .
Fortunately, the weak acid / conjugate base system can be treated like a buffer; hence, the usefulness of the Henderson-Hasselbalch equation. Recall that the Henderson-Hasselbalch equation is

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { Conj. base }]}{[\text { acid }]}
$$

[Conj. base] and [acid] can be re-written as $\mathrm{n}_{\text {sb }}$ and ( $\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}$ ), respectively* , or

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}
$$

* Why? OK, here goes: for every mole of conjugate base created, an equal number of moles of strong base must be added, so [Conj. base] $=\mathrm{n}_{\mathrm{sb}}$. Also, the moles of weak acid present in solution will depend on how many moles of strong base have been added, so [acid] $=\left(n_{w a}-n_{s b}\right)$.

Note that there is no volume dependence in the pre-equivalence region; you need not calculate total volume, etc. in this region if using the Henderson-Hasselbalch equation.

- Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K}_{\mathbf{a}}$

At half-equivalence, $1 / 2 \mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{sb}}$, and the $\log$ term in the pre-equivalence equation goes to zero $(\log 1=$ $0)$. Note that you can predict the $p H$ of any weak acid system at half-equivalence by calculating the $p K_{a}$ !

- Equivalence: $\mathbf{p H}=\mathbf{1 4}+\log ^{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}$

At the equivalence point, $\mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{sb}}$, and the only factor affecting pH is the conjugate base (see discussion on pre-equivalence, above.) To find $\left[\mathrm{OH}^{-}\right]$for a weak base, use:

$$
\left[\mathrm{OH}^{-}\right]=\sqrt{K_{b} \cdot C_{w b}}=\sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}
$$

For every mole of weak acid, an equal number of moles of conjugate base are created; hence, $\mathrm{n}_{\mathrm{cb}}=\mathrm{n}_{\mathrm{wa}}$. The term $\mathrm{V}_{\mathrm{cb}}$ must take into account the total volume present in solution, hence, $\mathrm{V}_{\mathrm{cb}}=\mathrm{V}_{\mathrm{wa}}+\mathrm{V}_{\mathrm{sb}}$. $\mathrm{K}_{\mathrm{b}}$ can be rewritten as $\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a}}$.
Converting [ $\mathrm{OH}^{-}$] to pH provides the necessary equation

$$
\mathrm{pH}=14+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}
$$

Note that in titrations of weak acids with strong bases, the equivalence point pH will be affected by the pH of the conjugate base only; no weak acid remains in solution. Therefore, expect basic pH values at the equivalence point in weak acid + strong base titrations.

- Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{w a}}{V_{s b}+V_{w a}}\right)$

The pH will reflect the excess strong base remaining after neutralizing the weak acid. ( $\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{wa}}$ )
Note that the contribution of the conjugate base will have no appreciable effect on the pH assuming even a small portion of strong base is present in solution; therefore, it is omitted from the calculation.

Example: $\quad$ Titrate 50.0 mL of $0.100 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\left(\mathrm{~K}_{\mathrm{a}}=1.80^{*} 10^{-5}\right)$ with 0.100 M NaOH . Determine the pH after $0.00,10.0,25.0,40.0,50.0$ and 60.0 mL of NaOH has been added.
$\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ is a weak acid, NaOH is a strong base; the equivalence point should be basic
$\mathbf{V}_{\mathrm{wa}}=50.0 \mathrm{~mL}=0.0500 \mathrm{~L}$
$\mathbf{n}_{\mathbf{w a}}=0.100 \mathrm{M}^{*} 0.0500 \mathrm{~L}=\mathbf{0 . 0 0 5 0 0} \mathbf{~ m o l}$
$\mathbf{C}_{\text {sb }}=\mathbf{0 . 1 0 0 ~ M}$
$\mathbf{V}_{\mathbf{s b}}=0.00500 \mathrm{~mol} / 0.100 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ N a O H}$ to the equivalence point
The half-equivalence point will be reached at $(50.0 \mathrm{~mL} / 2)$ or $\mathbf{2 5 . 0} \mathbf{~ m L ~ N a O H}$
$\mathbf{p K}_{\mathbf{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log \left(1.80^{*} 10^{-5}\right)=4.74$
At 0.00 mL : Initial point:

$$
\mathrm{pH}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}=-\log \sqrt{1.80 \times 10^{-5} \cdot \frac{0.00500}{0.0500}}=\mathbf{2 . 8 7}
$$

The pH reflects only the weak acid; no strong base has been added at this point.

Note how the initial pH of a weak acid is considerably more basic than the initial pH of a strong acid; this is due to the incomplete ionization of the weak acid (and the resulting dependency on $\mathrm{K}_{\mathrm{a}}$.)

At 10.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)=4.74+\log \left(\frac{0.00100}{0.00500-0.00100}\right)=4.14
$$

At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 1 0 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0100 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$
Note: $10.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At 25.0 mL : Half-equivalence point: $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}=\mathbf{4 . 7 4}$
This is a simple calculation but one which gives tremendous insight into the system being studied.
At 40.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)=4.74+\log \left(\frac{0.00400}{0.00500-0.00400}\right)=5.34
$$

At $40.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 4 0 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0400 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 4 0 0} \mathbf{~ m o l}$
Note: $40.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region

## At 50.0 mL : Equivalence point:

$$
\mathrm{pH}=14+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}=\mathbf{1 4}+\log \sqrt{\frac{\mathbf{1 0}^{-14}}{\mathbf{1 . 8 \times 1 0}} \cdot \frac{0.00500}{(0.0500+0.0500)}}=\mathbf{8 . 7 2}
$$

Note that this equation looks somewhat nasty, but really it's just a good old "plug and chug" equation. Notice how the equivalence pH is basic as predicted.

At 60.0 mL : Post-equivalence point:

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{w a}}{V_{s b}+V_{w a}}\right)=\mathbf{1 4}+\log \left(\frac{0.00600-0.00500}{0.0600+0.0500}\right)=\mathbf{1 1 . 9 6}
$$

At $60.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.0600 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 6 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{wa}}$. This point lies in the post-equivalence region.

The titration graph for a weak acid + strong base would look like the diagram below:

Note that the equivalence point is basic in a weak acid + strong base titration, a result of the conjugate base of the weak acid. Also note how the slope around the equivalence point is not as steep as it was when strong acids and bases were mixed together.

## Section Four: Weak Base + Strong Acid (WB + SA) Titration Equivalence Point pH $<7$ acidic

As discussed in section three ( $\mathrm{WA}+\mathrm{SB}$ ), weak acids and bases do not ionize completely in solution. For example, if we had a solution of $1.00 \mathrm{M} \mathrm{NH}_{3}$ (ammonia, a weak base) in water,

$$
\mathrm{NH}_{3(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}_{(\mathrm{aq})}
$$

we would have roughly $99 \%$ of the ammonia still present in solution; less than $1 \%$ of the $\mathrm{NH}_{3(\mathrm{aq})}$ would ionize with water into $\mathrm{NH}_{4}^{+}{ }_{(\mathrm{aq})}$ and $\mathrm{OH}^{-}(\mathrm{aq})$. Recall that $\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$ will be the conjugate acid in this system. This lack of complete ionization forces a dependency upon the base equilibrium constant, $\mathbf{K}_{\mathbf{b}}$, in our calculations.

As before, to speed our calculations when the weak base is present in excess, we can use the Henderson-Hasselbalch equation. We will use a slightly modified form for this section. The halfequivalence point will also be of use to use just as it was in the WA +SB titration.

## Before you begin:

## Determine the following quantities:

$\mathbf{V}_{\mathbf{w b}}=$ volume of weak base initially present
$\mathbf{n}_{\mathrm{wb}}=$ moles of weak base $\left(=\mathrm{C}_{\mathrm{wb}} * \mathrm{~V}_{\mathrm{wb}}\right)$
$\mathbf{K}_{\mathbf{b}}=$ base dissociation constant for the weak base
$\mathbf{p} \mathbf{K}_{\mathbf{b}}=-\log \mathrm{K}_{\mathbf{b}}$ (this is a just a unitless number)
$\mathbf{C}_{\mathrm{sa}}=$ concentration of strong acid
$\mathbf{V}_{\mathbf{s a}}=$ volume of strong acid to reach equivalence point $\left(=\mathrm{n}_{\mathrm{wb}} / \mathrm{C}_{\mathrm{sa}}\right)$
Also remember that at room temperature, $\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}$

## Analysis Section:

There are five regions in $\mathrm{WB}+\mathrm{SA}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}$

The pH will reflect the weak base only - no strong acid has been added. Recall that for weak bases,

$$
\left[\mathrm{OH}^{-}\right]=\sqrt{K_{b} \cdot C_{w b}}
$$

and $\mathrm{C}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{wb}} / \mathrm{V}_{\mathrm{wb}}$. Recall that $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$and that $\mathrm{pH}+\mathrm{pOH}=14$; therefore,

$$
\mathbf{p H}=14+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}
$$

- Pre-Equivalence Region: This region uses a modified version of the Henderson-Hasselbalch equation to calculate pH :

$$
\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)
$$

Because $\mathrm{n}_{\mathrm{wb}}>\mathrm{n}_{\mathrm{sa}}$ in this region, the pH will be affected by two factors: 1) the remaining weak base in the solution, and 2) the conjugate acid present upon addition of strong acid. For a weak base A- reacting with strong acid HCl ,

$$
\mathrm{A}^{-}+\mathrm{HCl} \rightarrow \mathrm{HA}+\mathrm{Cl}^{-}
$$

The species HA is the conjugate acid of the weak base $\mathrm{A}^{-}$, and it will react with water to re-form the weak acid:

$$
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{~A}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

The generation of $\mathrm{H}_{3} \mathrm{O}^{+}$from the conjugate acid will affect pH .
As in the weak acid / strong base scenario, the weak base / conjugate acid system can be treated like a buffer; hence, the usefulness of the Henderson-Hasselbalch equation. Recall that the Henderson-Hasselbalch equation is

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { Conj. base }]}{[\text { acid }]}
$$

We will modify the Henderson-Hasselbalch equation to our weakly basic system. [Conj. base] and [acid] can be re-written as ( $\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}$ ) and $\mathrm{n}_{\mathrm{sa}}$, respectively* , and since $\mathrm{pK}_{\mathrm{a}}+\mathrm{pK}_{\mathrm{b}}=14$, we can re-write our equation as

$$
\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)
$$

* Why? OK, here goes: for every mole of conjugate acid created, an equal number of moles of strong acid must be added, so [acid] $=\mathrm{n}_{\text {sa }}$. Also, the moles of weak base present in solution will depend on how many moles of strong acid have been added, therefore [Conj. base] is ( $\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}$ ).

Note that there is no volume dependence in the pre-equivalence region; you need not calculate total volume, etc. in this region if using the Henderson-Hasselbalch equation.

## - Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K} \mathbf{a}_{\mathbf{a}}$

At half-equivalence, $1 / 2 \mathrm{n}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{sa}}$, and the $\log$ term in the pre-equivalence equation goes to zero $(\log 1=$ $0)$. Note that you can predict the $p O H$ of any weak base system at half-equivalence by calculating the $p K_{b}$ or the $p H$ via $p K_{a}$ ! Converting to pH requires a simple but necessary calculation.

- Equivalence: $\mathbf{p H}=-\log \sqrt{\frac{K_{w}}{K_{b}} \cdot \frac{n_{w b}}{\left(V_{w b}+V_{s a}\right)}}$

At the equivalence point, $\mathrm{n}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{sa}}$, and the only factor affecting pH is the conjugate acid (see discussion on pre-equivalence, above.) To find $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$for a weak acid:

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} \cdot C_{w a}}=\sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}
$$

For every mole of weak base, an equal number of moles of conjugate acid are created; hence, $\mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{wb}}$. The term $\mathrm{V}_{\mathrm{wa}}$ must take into account the total volume present in solution, hence, $\mathrm{V}_{\mathrm{wa}}=\mathrm{V}_{\mathrm{wb}}+\mathrm{V}_{\mathrm{sa}}$. $\mathrm{K}_{\mathrm{a}}$ can be rewritten as $\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{b}}$.
Converting $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$to pH provides the necessary equation

$$
\mathrm{pH}=-\log \sqrt{\frac{K_{w}}{K_{b}} \cdot \frac{n_{w b}}{\left(V_{w b}+V_{s a}\right)}}
$$

Note that in titrations of weak bases with strong acids, the equivalence point pH will be affected by the pH of the conjugate acid only; no weak base or strong acid remains in solution. Therefore, expect acidic pH values at the equivalence point in weak base + strong acid titrations.

- Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right)$

The pH will reflect the excess strong acid remaining after neutralizing the weak base.
$\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{wb}}$ in this region.
Note that the contribution of the conjugate acid will have no appreciable effect on the pH assuming even a small portion of strong acid is present in solution; therefore, it is omitted from the calculation.

Example: $\quad$ Titrate $100 . \mathrm{mL}$ of $0.0500 \mathrm{M} \mathrm{NH}_{3}\left(\mathrm{~K}_{\mathrm{b}}=1.80^{*} 10^{-5}\right)$ with 0.100 M HCl . Determine the pH after $0.00,10.0,25.0,50.0$ and 60.0 mL of HCl has been added.
$\mathrm{NH}_{3}$ is a weak base, HCl is a strong acid; the equivalence point should be acidic
$\mathbf{V}_{\mathbf{w b}}=100 . \mathrm{mL}=\mathbf{0 . 1 0 0} \mathrm{L}$
$\mathbf{n}_{\mathbf{w b}}=0.0500 \mathrm{M}^{*} 0.100 \mathrm{~L}=\mathbf{0 . 0 0 5 0 0} \mathbf{~ m o l}$
$\mathrm{C}_{\mathrm{sa}}=\mathbf{0 . 1 0 0 ~ M}$
$\mathbf{V}_{\mathbf{s a}}=0.00500 \mathrm{~mol} / 0.100 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ H C l}$ to the equivalence point
The half-equivalence point will be reached at $(50.0 \mathrm{~mL} / 2)$ or $\mathbf{2 5 . 0} \mathbf{~ m L ~ H C l}$
$\mathbf{p K} \mathbf{K}_{\mathbf{a}}=-\log \left(\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{b}}\right)=-\log \left(10^{-14} / 1.80^{*} 10^{-5}\right)=\mathbf{9 . 2 6}$
At 0.00 mL : Initial point:

$$
\mathrm{pH}=14+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}=\mathbf{1 4}+\log \sqrt{1.8 \times 10^{-5} \cdot \frac{0.00500}{0.100}}=\mathbf{1 0 . 9 8}
$$

The pH reflects only the weak base; no strong acid has been added at this point.
Note how the initial pH of a weak base is considerably more acidic than the initial pH of a strong base; this is due to the incomplete ionization of the weak base (and the resulting dependency on $\mathrm{K}_{\mathrm{b}}$.)

At 10.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)=\mathbf{9 . 2 6}+\log \left(\frac{0.00500-0.00100}{0.00100}\right)=\mathbf{9 . 8 6}
$$

At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sa}}=\mathbf{0 . 0 1 0 0} \mathrm{L}$, and $\mathrm{n}_{\mathrm{sa}}=0.0100 \mathrm{~L}^{*} 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$
Note: $10.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At $25.0 \mathrm{~mL}: \quad$ Half-equivalence point: $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}=14-\mathrm{pK}_{\mathrm{b}}=14-4.74=\mathbf{9 . 2 6}$
Although simple, this calculation gives tremendous insight into the system being studied.
At 50.0 mL : Equivalence point:

Note that this equation looks somewhat nasty, but really it's just a good old "plug and chug" equation. All of the values have been calculated, and the application will become easier with time.

Notice how the equivalence point pH is acidic as predicted.

## At 60.0 mL : Post-equivalence point:

$$
\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right)=-\log \left(\frac{0.00600-0.00500}{0.0600+0.100}\right)=\mathbf{2 . 2 0}
$$

At $60.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0600 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 6 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{wb}}$. This point lies in the post-equivalence region.

The titration graph for a weak base + strong acid would look like this:

Note that the equivalence point is acidic in a weak base + strong acid titration, a result of the conjugate acid of the weak base. Also note how the slope around the equivalence point is not as steep as it was when strong acids and bases were mixed together.

## CH 223 Titration Calculations - The Problems

Exercises: Complete these problems using the worksheet on the next page. Also, construct a graph of pH versus Volume of Titrant for each problem. Staple calculations to the back of the worksheet on separate paper. All pH calculations should be reported to the hundredths place.

1. You wish to titrate 50.00 mL of a 0.100 M HCl solution with 0.100 M NaOH . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 10.00 \mathrm{~mL}, 20.00 \mathrm{~mL}, 40.00 \mathrm{~mL}, 45.00 \mathrm{~mL}, 48.00 \mathrm{~mL}, 49.00 \mathrm{~mL}, 50.00 \mathrm{~mL}, 51.00 \mathrm{~mL}$, $55.00 \mathrm{~mL}, 60.00 \mathrm{~mL}, 80.00 \mathrm{~mL}$ and 100.00 mL of NaOH . Plot the results of your calculations as pH versus mL of NaOH added.
2. You wish to titrate 38.00 mL of a 0.1680 M KOH solution with $0.1120 \mathrm{M} \mathrm{HNO}_{3}$. Calculate the pH after the addition of $0.00 \mathrm{~mL}, 5.00 \mathrm{~mL}, 12.70 \mathrm{~mL}, 29.99 \mathrm{~mL}, 51.00 \mathrm{~mL}, 55.50 \mathrm{~mL}, 57.00 \mathrm{~mL}, 61.20 \mathrm{~mL}, 74.70 \mathrm{~mL}$, $82.20 \mathrm{~mL}, 88.50 \mathrm{~mL}, 92.30 \mathrm{~mL}$ and 100.00 mL of $\mathrm{HNO}_{3}$. Plot the results of your calculations as pH versus mL of $\mathrm{HNO}_{3}$ added.
3. A 25.00 mL solution of 0.100 M lactic acid $\left(\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{3}, \mathrm{pK}_{\mathrm{a}}=3.85\right)$ is titrated with 0.100 M LiOH . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 4.00 \mathrm{~mL}, 8.00 \mathrm{~mL}, 12.50 \mathrm{~mL}, 20.00 \mathrm{~mL}, 24.00 \mathrm{~mL}, 24.50$ $\mathrm{mL}, 25.00 \mathrm{~mL}, 26.00 \mathrm{~mL}, 28.00 \mathrm{~mL}, 30.00 \mathrm{~mL}, 35.00 \mathrm{~mL}$ and 40.00 mL of LiOH. Plot the results of your calculations as pH versus mL of LiOH added.
4. A student titrates 29.00 mL of 0.2250 M pyridine $\left(\mathrm{K}_{\mathrm{b}}=1.7^{*} 10^{-9}\right)$ with 0.3750 M HBr . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 2.00 \mathrm{~mL}, 3.60 \mathrm{~mL}, 5.00 \mathrm{~mL}, 6.50 \mathrm{~mL}, 8.70 \mathrm{~mL}, 9.90 \mathrm{~mL}, 10.00 \mathrm{~mL}, 10.80$ $\mathrm{mL}, 15.00 \mathrm{~mL}, 17.40 \mathrm{~mL}, 18.70 \mathrm{~mL}$ and 36.00 mL of HBr . Plot the results of your calculations as pH versus mL of HBr added.
$\qquad$
Provide answers to the questions (found on the previous page) using the sheet below.

- Report all pH values to the hundredths place.
- Circle the equivalence point and the half-equivalence point (if appropriate) volume on the handout
- Include computer generated graphs (using Excel, etc.) of the titrations and all necessary calculations on separate paper stapled to the back of this handout.

| Question \#1 |  | Question \#2 |  | Question \#3 |  | Question \#4 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Volume NaOH | pH | Volume $\mathrm{HNO}_{3}$ | pH | Volume LiOH | pH | Volume HBr | pH |
| 0.00 |  | 0.00 |  | 0.00 |  | 0.00 |  |

## This page left blank for printing purposes

# CH 223 Spring 2024: <br> "Acid \& Base Titrations (in class)" Lab - Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/5b.htm

## Step One:

Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-5-2 through Ia-5-9 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2-point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, April 22 (section 01) or Wednesday, April 24 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

## Step Three:

Complete the lab work and calculations on your own, then turn it in (pages Ia-5-5 through Ia-5-9 only to avoid a point penalty) at the beginning of recitation to the instructor on Monday, April 29 (section 01) or Wednesday, May 1 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Acid \& Base Titrations

During the next several labs you will perform titrations on acids and bases to determine various properties about these solutions. This first lab is designed as an introduction to titration with acids and bases. The focus of this lab will be to familiarize you with the Vernier computer system and to perform a titration using it. The program you use can be modified as needed in the following lab classes.

A titration is a process by which a solution of known concentration is quantitatively added to a solution of unknown concentration in order to determine its concentration. You will be using burets to perform the titrations. The titration end point or equivalence point is when stoichiometrically equivalent amounts of the two substances are present. Therefore, it is necessary to create a method for determining the endpoint of the titration. In an acid-base titration, the change in the acidity or pH of the solution is a convenient method to determine this equivalence point.

There are two methods to measure the pH of a solution. In the first method a chemical called an indicator is used that changes color upon a change in the acidity of the solution. Litmus and phenolphthalein are examples of common indicators. The second method is to use a $\mathbf{p H}$ meter to measure the pH of the solution as the titration proceeds.

In this lab you will use a Vernier interface with a pH probe to measure the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$of the solution. The program will graph the progress of the titration as the titrant is added from the buret (measured with a drop counter.) A plot of the pH of a solution against the volume of titrant added is called a titration curve. From the titration curve, the equivalence point can be determined as the point of maximum slope. For an acid-base titration, the equivalence point occurs when moles of acid equal moles of base: $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{-}\right]$. Furthermore, the equivalence point will reveal whether the solution consists of a strong or weak acid.

For an acid, HA, in solution, the equilibrium constant $\mathrm{K}_{\mathrm{a}}$ for the process can be determined:

$$
\mathrm{HA}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}_{(\mathrm{aq})}^{+}+\mathrm{A}_{(\mathrm{aq})}^{-} \quad \mathrm{K}_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}+\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}
$$

Recall that in solution, there is also a second equilibrium of concern:

$$
2 \mathbf{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}, \quad \mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=\mathbf{1 . 0 0} * \mathbf{1 0}-14
$$

For a strong acid, $\mathrm{K}_{\mathrm{a}}$ is so large that the acid dissociates completely into $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{A}^{-}$such that $[\mathrm{HA}]=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ even in the untitrated state. At equivalence, the dissociation of water governs the pH , and the $\mathrm{pH}=7$.

For a weak acid, $\mathrm{K}_{\mathrm{a}}$ is small and hence influences the pH . The initial pH of the solution will appear higher than that of a strong acid and the pH at the equivalence point is not 7. To calculate $\mathrm{K}_{\mathrm{a}}$, you will need to determine the pH halfway to the equivalence point. At the halfway point or half equivalence point, half of the acid has been titrated such that $\left[A^{-}\right]=[H A]$. This will reduce the equilibrium expression to $\mathrm{K}_{\mathrm{a}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$or $\mathbf{p H}=\mathbf{p} \mathbf{K}_{\mathbf{a}}$. Therefore, if the volume at the equivalence point is determined, the pH at half that volume will reveal $\mathrm{pK}_{\mathrm{a}}$.

## PERFORMING THE EXPERIMENT - Instructions

You will use a Vernier interface and equipment to titrate three acids using NaOH . Note the setup of the Vernier equipment carefully; you shall perform several similar titrations during this lab period and in the weeks to come. At the end, optionally upload your graphs (and maybe data files) to your email account and analyze them later at your convenience.

1. Obtain approximately 65 mL of NaOH solution in a 250 mL beaker.
2. Obtain a 25 or 50 mL buret and connect it to a ring stand using a buret clamp. Rinse the buret with a few mL of the NaOH and discard into a waste jar. Now fill the buret to the 0.00 mL line. Drain a small amount of NaOH solution into the 250 mL beaker so it fills the buret's tip. Use a disposable pipet to ensure the NaOH volume is still at 0.00 mL .
3. Connect the pH Sensor to CH 1 of the Vernier LabQuest 2 Interface. Lower the Drop Counter onto a ring stand and connect it to DIG 1. Choose New from the File menu.
4. Calibrate the Drop Counter so that a precise volume of titrant is recorded in units of milliliters.
a. Choose Sensors Calibrate Drop Counter from the Sensors menu. If you do not see the "Sensors" entry at the top, push the "Meter" icon in the upper left corner.
-If you have previously calibrated the drop size of your buret and want to continue with the same drop size, tap Equation after selecting the "Drop Counter" in the "Calibrate" menu. Enter the value for drops/ mL . Select Done, then OK. Proceed directly to the next section.
-If you want to perform a new calibration (i.e. if you change burets), continue with this step.
b. Select Calibrate Now.
c. Place a 10 mL graduated cylinder directly below the slot on the Drop Counter, lining it up with the tip of the buret.
d. Open the valve on the buret. Slowly add NaOH from the buret at a slow rate ( $\sim 1$ drop every second). You should see the drops being counted on the screen.
e. When the volume of NaOH solution added from the buret is between 3 and 9 mL , close the buret.
f. Enter the precise Volume of NaOH to 0.01 mL . Select Done. Record the number of drops $/ \mathrm{mL}$ displayed on the screen (Sensors Calibrate Drop Counter then Equation) for possible future use. Select OK.
g. It's also recommended to calibrate the $\mathbf{p H}$ meter (Sensors Calibrate $\rightarrow \mathbf{p H}$ Meter). Use a two point calibration (at pH of 4 and 10 using buffer solutions in small beakers.)
5. Discard the NaOH solution in the graduated cylinder and set it aside. Fill the NaOH in the buret to the 0.00 mL level.
6. Using a graduated cylinder, measure $5.00 \mathbf{m L} \mathbf{~ H C l}$ (record the concentration!) into a 250 mL beaker. Add about 100 mL of water.
7. Assemble the apparatus.
a. Place a magnetic stirrer under or near the ring stand with the buret. Place a stir bar in the 250 mL beaker with the HCl and place it on the magnetic stirrer.
b. Rinse the pH sensor with water, then insert it through the large hole in the Drop Counter and attach it to the ring stand. Make sure the stir bar does not touch the bulb of the pH sensor.
c. Adjust the positions of the Drop Counter and buret so they are both lined up. Test the positioning by releasing a few drops of NaOH ; if the red light on the drop counter appears and disappears, all is well; if not, readjust the buret so the drops are counted. Also make sure the pH Sensor is just touching the bottom of the beaker.

8. Turn on the magnetic stirrer so that the stir bar is stirring at a fast rate, but not hitting the pH sensor bulb.
9. You are now ready to begin collecting data! Check to see that the pH value is acidic (you are starting with an acid.)
10. Start data collection by pressing the "start" button (the green arrow in the corner of the LabQuest.) No data will be collected until the first drop goes through the Drop Counter slot. Open the buret valve so that about 1 drop is released every 1 second or so. When the first drop passes through the Drop Counter slot, check the graph to see that the first data pair was recorded.
11. Continue watching your graph to see when a large increase in pH takes place-this will be the equivalence point of the reaction. When this jump in pH occurs, let the titration proceed for several more milliliters of titrant, then stop data collection (the red square in the corner) to view the graph of pH vs. volume. Make sure you see the " $S$ " curve (or more if the acid is polyprotic.)
12. Dispose of the beaker contents in a waste jar, remembering not to put the stir bar in the waste jar.
13. Examine the data on the displayed graph of pH vs. volume (in mL ) using your finger or the stylus to estimate the equivalence point volume and pH . Record the $\mathbf{p H}$ value in your notebook and record the $\mathbf{N a O H}$ volume in $\mathbf{m L}$ at the equivalence point. Note: if this is a weak acid graph, also record the half equivalence volume and the half equivalence pH value.
14. Optional: Email copies of each graph for later analysis (if this is available.) In the LabQuest app, select (upper left corner) File -> Email -> Graph, fill out the "To" line (and maybe the CC: line(s)), then select "Send." Note: emailing a graph is optional, but nice to have if it is available.
15. Optional step for Excel power users: You can make your own graph; to do so, File -> Email -> Text File, send it to yourself, then import into Excel (the data file is a Tab delimited text file) and create an xy-scatter graph.... if you try this optional step and get stuck, email the instructor. Do not email yourself the "Data File" unless you have the Vernier software installed on your device.
16. You are now done with Experiment $\# 1(\mathrm{HCl}+\mathrm{NaOH})$. ©
17. Experiment \#2 will be similar, but this time with acetic acid. Repeat the above procedure with HCl but substitute acetic acid for HCl (use the same volumes, etc.) Make sure to rinse the $\mathbf{p H}$ meter with water before inserting it into a new solution. Remember to record the acetic acid concentration!
18. Experiment \#3 will be similar, but this time with phosphoric acid. Repeat the above procedure with HCl but substitute phosphoric acid for HCl (use the same volumes, etc.) Remember to record the phosphoric acid concentration! Make sure your pH at the end of the titration if quite basic.... this is a polyprotic acid, and the graph should look quite different.

Use these instructions as you gather data and analyze three titrations.

Special note: we will be using these instructions during the next lab (Titration of Weak Acids), so bring these pages to that lab as well!

## Acid \& Base Titrations - Worksheet

Submitting graphs with this lab is optional - ask the instructor if this option is available.

## YOUR NAME:

$\qquad$ LAB PARTNER: $\qquad$
Purpose: To explore acid-base pH titrations for three types of acid + strong base systems.

## Experiment \#1: $\mathrm{HCl}+\mathrm{NaOH}$

Determine the equivalence point volume and $\mathbf{p H}$ from the graph. Using the equivalence point volume and the exact concentration of the HCl , determine the molarity of the pure (initial) $\mathbf{N a O H}$ solution (i.e. before the NaOH reacted with the HCl .)

Equivalence point volume of $\mathrm{NaOH}(\mathrm{mL})$ : $\qquad$ Equivalence point pH: $\qquad$
Concentration of HCl used in lab (M): $\qquad$
Using the equivalence point volume and the exact concentration of the HCl , determine the molarity of the pure (initial) $\mathbf{N a O H}$ solution (i.e. before the NaOH reacted with the HCl .) Show your work!

HCl is a: strong acid strong base weak acid weak base (Circle one)
NaOH is a: strong acid strong base weak acid weak base (Circle one)
What should be the equivalence point pH be for this experiment?

$$
\text { less than } 7 \text { equal to } 7 \quad \text { greater than } 7 \text { (Circle one) }
$$

Assume it takes 2.80 mL of 0.1100 M NaOH to titrate 5.00 mL of HCl . Calculate the concentration of $\mathbf{H C l}$ using this data (and show your work!)

## Experiment \#2: Acetic Acid - NaOH

Determine the equivalence point volume and pH from the graph. Based on the volume added at the equivalence point, record the $\mathbf{p H}$ and volume at the half-equivalence point. Determine the $K_{a}$ value based on the half equivalence point data.

Equivalence point volume of $\mathrm{NaOH}(\mathrm{mL})$ : $\qquad$ Equivalence point pH : $\qquad$

Half Equivalence point volume of $\mathrm{NaOH}(\mathrm{mL})$ : $\qquad$ Half Equivalence point pH : $\qquad$

Experimental Ka of acetic acid: $\qquad$ Show work
acetic acid is a: strong acid strong base weak acid weak base (Circle one)
What should be the equivalence point pH be for this experiment?

$$
\text { less than } 7 \quad \text { equal to } 7 \quad \text { greater than } 7 \text { (Circle one) }
$$

Why is the half-equivalence pH (and half-equivalence volume) important in this titration? Explain.

Acetic acid has a known $\mathrm{K}_{\mathrm{a}}$ of $1.8 \times 10^{-5}$ via the literature. Find the percent error for this experiment. Recall: Percent error $=$ absolute value $\{($ actual - experimental $) /$ actual $\} * \mathbf{1 0 0 \%}$

Draw the Lewis structure of acetic acid showing all bonds and lone pair electrons:

## Experiment \#3: Phosphoric Acid - $\mathbf{N a O H}$

Record the volume and $\mathbf{p H}$ values at the TWO equivalence points (first and second) for the phosphoric acid solution. (In most cases, you will not be able to observe the third equivalence point.) Use your data and/or graphs to determine the exact equivalence points.

Record the $\mathbf{p H}$ and volume at each half-equivalence point (first and second). Determine the value of $K_{\text {a1 }}$ and $K_{\mathrm{a} 2}$ using the two half equivalence point values on your graph. Note that to find $\mathrm{K}_{\mathrm{a} 2}$, take the mid-point volume between the first equivalence point and the second equivalence point.
phosphoric acid is a: strong acid strong base weak acid weak base (Circle one)

From the graph, estimate the first equivalence volume: $\qquad$ mL

From the graph, estimate the first equivalence pH : $\qquad$

From the graph, estimate the first half-equivalence volume: $\qquad$ mL

From the graph, estimate the first half-equivalence pH : $\qquad$

Using this value, calculate the value of $\mathrm{K}_{\mathrm{a} 1}$ for phosphoric acid: $\qquad$ Show work

Write the balanced equation used for $\mathrm{K}_{\mathrm{a} 1}$ of phosphoric acid

$$
\mathbf{H}_{3} \mathbf{P O}_{4}(\mathbf{a q})+\mathbf{H}_{2} \mathbf{O}(\mathbf{l}) \rightleftharpoons+\quad+
$$

## Experiment \#3: Phosphoric Acid - NaOH Continued

From the graph, estimate the second equivalence volume: $\qquad$ mL

From the graph, estimate the second equivalence pH : $\qquad$

From the graph, estimate the second half-equivalence volume: $\qquad$ mL

From the graph, estimate the second half-equivalence pH : $\qquad$

Using this value, calculate the value of $\mathrm{K}_{\mathrm{a} 2}$ for phosphoric acid: $\qquad$ Show work

Write the balanced equation used for $\mathrm{K}_{\mathrm{a} 2}$ of phosphoric acid:
$\qquad$

## Postlab Questions:

1. If you titrate 100 mL of an unknown strong acid solution with 0.1 M NaOH , will the pH ever reach a value of 13? Explain.
2. What should the pH value be for the third half-equivalence point for phosphoric acid? Explain. Calculate what the exact value should be by using the table of acid dissociation constants in problem set \#2.
3. What is the molarity of an HCl solution if 25.00 mL of the acid solution required 42.68 mL of 0.2525 M NaOH solution to reach the equivalence point?
4. A student titrates 50.0 mL of a weak acid, HA, with 0.100 M NaOH . It requires 43.68 mL of 0.100 M NaOH to reach the equivalence point of the titration.
a. Calculate the moles of HA present.
b. Calculate the original (undiluted) concentration of the weak acid solution.
c. It took 21.84 mL of 0.100 M NaOH to reach the half-equivalence point for this reaction, and the pH of the solution at this point was 6.00 . Calculate the $K_{a}$ for the weak acid.

# CH 223 Spring 2024: "Titration of Weak Acids (in class)" Lab - Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/6b.htm

## Step One:

Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-6-3 through Ia-6-4 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2-point deduction.

* Special Note: Also bring a printed copy of the "Acid and Base Titrations" instructions for the Vernier pH titration equipment (we will use these again this week.)

Step Two:
Bring the printed copy of the lab (and the Vernier instructions) with you on Monday, April 29 (section 01) or Wednesday, May 1 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

## Step Three:

Complete the lab work and calculations on your own, then turn it in (pages Ia-6-3 through Ia-6-4 only to avoid a point penalty) at the beginning of recitation to the instructor on Monday, May 6 (section 01) or Wednesday, May 8 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## This page left blank for printing purposes

Titration of Weak Acids
Complete the following questions. All work must be shown to receive full credit.

Name:
Lab Partner(s):

1. Perform in the lab

Select an unknown acid and titrate two samples of the acid per the guidelines in the "Acid and Base Titration" lab.
Measure approximately 0.5 g of the unknown acid sample using an analytical balance (record to 0.0001 g ) and dissolve each sample in about 75 mL of water. Record the following information for each sample; show all work and include calculations. Optionally include titration graphs for Sample \#1 and Sample \#2, but it is not required.
[ NaOH ] (M): $\qquad$ [ NaOH ] (M): $\qquad$

$$
\text { Sample \#1 } \quad \text { Letter }=
$$

$$
\text { Sample \#2 } \text { Letter }=

## CH 223 Spring 2024: ${ }^{6}$ Determination of $K_{s p}, \Delta \mathbf{G}^{\circ}$, $\Delta H^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ for $\mathrm{Ca}(\mathbf{O H}) 2^{\prime \prime}$ (in class) Lab: Instructions

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:

## http://mhchem.org/q/7b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-7-2 through Ia-7-12 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2-point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, May 13 (section 01) or Wednesday, May 15 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

## Step Three:

Complete the lab work and calculations on your own, then turn it in (pages Ia-7-5 through Ia-7-12 only to avoid a point penalty) at the beginning of recitation to the instructor on Monday, May 20 (section 01) or Wednesday, May 22 (section H1.) The graded lab will be returned to you the following week during recitation.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Determination of $K_{\text {sp }}, \Delta G^{\circ}, \Delta H^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ for $\mathrm{Ca}(\mathbf{O H})_{2}$

The solubility of hydroxides is easily determined through a titration with a suitable acid (such as HCl ). From the molar solubility, the solubility equilibrium constant, $\mathrm{K}_{\text {sp }}$, can be calculated and from this the $\Delta \mathrm{G}^{\circ}$ for the dissolution of the material can be determined. Using $\Delta \mathrm{G}^{\circ}$ values at two different temperatures and noting that the values of $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ are relatively invariant over small temperature ranges, the enthalpy and entropy changes can also be estimated. With knowledge of these constants, $\Delta \mathrm{G}^{\circ}$ and $\mathrm{K}_{\text {sp }}$ can be calculated at any temperature between $0{ }^{\circ} \mathrm{C}$ and $100^{\circ} \mathrm{C}$.

## THE REACTION:

The solubility of an ionic substance in a solvent can be thought of as a reaction where the solid dissociates into ions in solution. In this experiment, the solubility of calcium hydroxide will be determined, as suggested in the reaction shown below.

$$
\mathrm{Ca}(\mathrm{OH})_{2(\mathrm{~s})} \rightleftharpoons \mathrm{Ca}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{OH}_{-(\mathrm{aq})}^{-}
$$

Once equilibrium has been established and the solid removed, the concentration of hydroxide can be easily determined via an acid/base titration. Hydrochloric acid will be used to find the concentration of $\mathrm{OH}^{-}$(aq).

$$
\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{OH}_{-(\mathrm{aq})}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}+\mathrm{Cl}^{-(\mathrm{aq})}
$$

Note that the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ is half of the $\mathrm{OH}^{-}$concentration found by titration.

## Determination of $\mathbf{K}_{\text {sp }}, \Delta \mathbf{G}^{\circ}, \Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$

The concentration of hydroxide ion in a saturated solution of $\mathrm{Ca}(\mathrm{OH})_{2}$ is found by titration with standardized hydrochloric acid. Since HCl is a strong acid and $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$react with $1: 1$ stoichiometry, we can use:

$$
\mathrm{M}_{\mathrm{HCl}} \mathrm{~V}_{\mathrm{HCl}}=\mathrm{MoH}_{\mathrm{OH}} \mathrm{~V}_{\mathrm{OH}}
$$

where MHCl and $\mathrm{Moh}_{\mathrm{H}}$ are the molarities and $\mathrm{V}_{\mathrm{HCl}}$ and $\mathrm{VOH}_{\mathrm{OH}}$ are the volumes of the acid and hydroxide solutions, respectively. The molar solubility of the salt is equal to half of the hydroxide ion concentration

The equilibrium constant, $\mathbf{K}_{\text {sp }}$, for $\mathrm{Ca}(\mathrm{OH})_{2}$ is:

$$
K_{\text {sp }}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}
$$

Remember that the calcium ion concentration is half the hydroxide ion concentration determined by the titration.

The Gibbs Free Energy, $\Delta \mathbf{G}^{\circ}$, is related to the equilibrium constant $\left(\mathrm{K}_{\text {sp }}\right)$ by

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln K_{\mathrm{sp}}
$$

where $\mathbf{R}$ is the ideal gas constant $(\mathrm{R}=8.3145 \mathrm{~J} / \mathrm{mol}-\mathrm{K})$ and $\mathbf{T}$ is the absolute temperature in Kelvin.

To find the enthalpy ( $\Delta \mathbf{H}^{\circ}$ ) and entropy ( $\Delta \mathbf{S}^{\circ}$ ) changes, the following equation is used

$$
\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}
$$

where $\mathbf{T}$ is the absolute temperature. We assume that $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ do not change significantly with temperature which is usually true for this small of a temperature change. Using the free energies $\left(\Delta G^{\circ}\right)$ found for two different temperatures, $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ values are found by solving for two unknowns in two equations.

## Example:

Consider the solubility of $\mathrm{Sr}(\mathrm{OH})_{2}$. Two solutions of $\mathrm{Sr}(\mathrm{OH})_{2}$ are allowed to equilibrate, one at $0{ }^{\circ} \mathrm{C}$ and the other at $25^{\circ} \mathrm{C}$. A 10.00 mL aliquot of each solution is titrated with 0.2000 M HCl .3 .37 mL of the acid are required for the $0{ }^{\circ} \mathrm{C}$ solution, and 62.90 mL are required for the $25^{\circ} \mathrm{C}$ solution.

At $0{ }^{\circ} \mathrm{C}$, the $\left[\mathrm{OH}^{-}\right]$is found using:

$$
\left[\mathrm{OH}^{-}\right]=\left([\mathrm{HCl}] * \mathrm{~V}_{\mathrm{HCl}}\right) / \mathrm{V}_{\mathrm{OH}-}=(0.2000 \mathrm{M} * 3.37 \mathrm{~mL}) / 10.00 \mathrm{~mL}=\mathbf{0 . 0 6 7 4} \mathbf{~ M}
$$

Thus, the molar solubility of $\mathrm{Sr}(\mathrm{OH})_{2}$ at $0^{\circ} \mathrm{C}$ is $0.0674 / 2=\mathbf{0 . 0 3 3 7} \mathbf{~ M} . \mathrm{K}_{\text {sp }}$ at $0{ }^{\circ} \mathrm{C}$ can then be found:

$$
\mathbf{K}_{\mathbf{s p}}=\left[\mathrm{Sr}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=[0.0337][0.0674]^{2}=\mathbf{1 . 5 3} * \mathbf{1 0}^{-4}
$$

$\Delta \mathrm{G}^{\circ}$ can be determined at $0{ }^{\circ} \mathrm{C}(273 \mathrm{~K})$ :

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{~K}_{\mathrm{sp}}=-(8.3145)(273) \ln \left(1.53 * 10^{-4}\right)=\mathbf{1 9 . 9} \mathbf{~ k J} / \mathbf{m o l}
$$

Similarly, the molar solubility at $25^{\circ} \mathrm{C}$ is found to be $0.6290 \mathrm{M} ; \mathrm{K}_{\text {sp }}$ is 0.995 ; and $\Delta \mathrm{G}^{\circ}$ is $0.0124 \mathrm{~kJ} / \mathrm{mole}$.
Now we can determine $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ using the values of $\Delta \mathrm{G}^{\circ}$ at two temperatures:

$$
\begin{gathered}
\Delta \mathrm{G}^{\circ}=19.9 \mathrm{~kJ} / \mathrm{mole}=\Delta \mathrm{H}^{\circ}-\left(273 * \Delta \mathrm{~S}^{\circ}\right) \\
\Delta \mathrm{G}^{\circ}=0.0124 \mathrm{~kJ} / \mathrm{mole}=\Delta \mathrm{H}^{\circ}-\left(298 * \Delta \mathrm{~S}^{\circ}\right)
\end{gathered}
$$

Subtracting the second equation from the first provides

$$
\begin{gathered}
19.9 \mathrm{~kJ} / \mathrm{mol}-0.0124 \mathrm{~kJ} / \mathrm{mol}=\Delta \mathrm{H}^{\circ}-\Delta \mathrm{H}^{\circ}-\left(273 * \Delta \mathrm{~S}^{\circ}\right)+\left(298 * \Delta \mathrm{~S}^{\circ}\right) \\
19.9 \mathrm{~kJ} / \mathrm{mole}=25 \Delta \mathrm{~S}^{\circ}
\end{gathered}
$$

so $\Delta \mathrm{S}^{\circ}=0.80 \mathrm{~kJ} / \mathrm{mole}-\mathrm{K}$. Using this value of $\Delta \mathrm{S}^{\circ}$ at either temperature gives $\Delta \mathrm{H}^{\circ}=240 \mathrm{~kJ} / \mathrm{mole}$.

## PROCEDURE:

1. Record the concentration of the standardized HCl provided in the laboratory. Obtain about 40 mL of this HCl solution and place it in a 25 mL buret.
2. A solution of calcium hydroxide will be stirring at room temperature in the laboratory. Draw off approximately 40 mL of this solution and record the temperature. Filter the solution using a long stem funnel until you have at least 30 mL of filtrate (if the filtering is slow, consider starting step 3 below.) Place 10.0 mL of the filtrate into a clean 125 mL Erlenmeyer flask and add 25 mL of distilled water and a few drops of bromothymol blue indicator. Titrate with the standard HCl solution until the yellow endpoint appears (probably no more than 5 mL of HCl will be required to reach the endpoint). Record the volume of HCl used to 0.01 mL . Repeat this procedure two more times.
3. Prepare a $100{ }^{\circ} \mathrm{C}$ saturated calcium hydroxide solution by bringing 100 mL of distilled water to a boil in a 250 mL beaker. After the water has been boiling for several minutes, add about 2 g of $\mathrm{Ca}(\mathrm{OH})_{2}$ to the water and keep it near boiling with occasional stirring until needed.
4. Bring your hot solution to a gentle boil for about two minutes, turn off the burner, measure the temperature and quickly draw off about $40-50 \mathrm{~mL}$ of solution. Quickly filter the solution using a clean, dry long stem funnel.
5. Place 10.0 mL of the cooled filtrate into each of three clean 125 mL Erlenmeyer flasks and add 25 mL of distilled water and a few drops of bromothymol blue indicator. When the solution is cool, titrate with the standard HCl solution until the yellow endpoint appears (probably no more than 5 mL of HCl will be required to reach the endpoint). Record the volume of HCl used to 0.01 mL . Repeat two more times.
6. Dispose of all used and excess chemicals in a waste container. Rinse your buret and all glassware with water before returning to its original location.

CALCULATIONS: Be sure to look at the example on the previous page for hints on how to get started!

1. Find the average solubility (and parts per thousand) of calcium hydroxide at each temperature by finding the hydroxide ion concentration and then converting this value to the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$. If one of the three equivalence point volumes differs from the other two, it is acceptable to omit the differing value and use the two values with close precision.
2. Find $\mathbf{K}_{\text {sp }}$ at each temperature using the average solubility value. Find $\Delta \mathbf{G}^{\circ}$ at each temperature using the two values of $K_{\text {sp }}$.
3. Find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ using the values of $\mathrm{K}_{\mathrm{sp}}$ and $\Delta \mathrm{G}^{\circ}$ at the two temperatures.

# Determination of $K_{\mathrm{sp}}, \Delta \mathbf{G}^{\circ}, \Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ for $\mathrm{Ca}(\mathrm{OH})_{2}$ - Worksheet 

## Your name:

Purpose: The goal of this lab is to find $K_{\mathrm{sp}}, \Delta \mathrm{G}^{\circ}, \Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for $\mathrm{Ca}(\mathrm{OH})_{2}$. Data:

## Concentration of $\mathrm{HCl}(\mathrm{M})$ :

$\qquad$

Temperature for first set of data $=$ $\qquad$ ${ }^{\circ} \mathrm{C}$ Lower temperature

Temperature for second set of data $=$ $\qquad$ ${ }^{\circ} \mathrm{C}$ Higher Temperature
mL HCl titrated at lower Temperature $\quad \mathrm{mL} \mathrm{HCl}$ titrated at higher Temperature

Notes: (optional)

Goal \#2: Determine the solubility of $\mathbf{C a}(\mathbf{O H})_{2}$ at two different temperatures. We will do two simultaneous calculations in order to find the solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ at each temperature. We can use the mL of HCl titrated and the molarity to find moles of HCl , and this equals moles of hydroxide (1:1 ratio). There are two hydroxides per one $\mathrm{Ca}(\mathrm{OH})_{2}$, so we will apply this stoichiometry to find the moles of $\mathrm{Ca}(\mathrm{OH})_{2}$ in the original mixture. Dividing by the liters of $\mathrm{Ca}(\mathrm{OH})_{2}$ used ( 0.0100 L in this lab) will give us the solubility. This calculation scheme will be applied to both temperature sets in order to find the solubility at each temperature.

## Convert $\mathbf{m L}$ of HCl into moles of $\left[\mathrm{OH}^{-1}\right]$ at each temperature:

Convert mL to $L$ of HCl
Multiply $L$ of HCl by $\left(\mathrm{HCl}\right.$ molarity) ${ }^{*}\left(1 \mathrm{~mol} \mathrm{OH}^{-1} / 1 \mathrm{~mol} \mathrm{HCl}\right)=$ this equals moles $\mathrm{OH}^{-1}$ moles $\mathrm{OH}^{-1 *}\left(1 \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{2} / 2\right.$ moles $\left.\mathrm{OH}^{-1}\right) / 0.0100 \mathrm{~L}=$ solubility of $\mathrm{Ca}(\mathrm{OH})_{2}($ in M$)$

Concentration HCl (M): $\qquad$ from Goal \#1

At lower temperature:

Temperature $=$ $\qquad$ ${ }^{\circ}$ C from Goal \#1
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M

## Average of three lower temperature solubilities =

$\qquad$

## Parts per thousand $=$

$\qquad$

Show examples of how this work was accomplished

## Goal \#2: (continued)

At higher temperature:

Temperature $=$ $\qquad$ ${ }^{\circ}$ C from Goal \#1
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M

Average of three higher temperature solubilities $=$ $\qquad$

Parts per thousand $=$ $\qquad$
Info on parts per thousand: https://mhchem.org/ppt

Show examples of how this work was accomplished

Goal \#3: Find the value of $K_{\text {sp }}$ and $\Delta \mathbf{G}^{\circ}$ at each temperature. We can use $K_{\text {sp }}=4(\text { solubility })^{3}$ to convert each average solubility into a $K_{\text {sp }}$ value. Using $K_{\text {sp }}$, we can convert each value into a $\Delta G^{\circ}$ using the relation $\Delta G^{\circ}=-R T \ln K_{\mathrm{sp}}$ where $\boldsymbol{R}=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$ and $\boldsymbol{T}=$ Kelvin temperature

At lower temperature:
Lower temperature $\left({ }^{\circ} \mathrm{C}\right)=$ $\qquad$ from Goal \#1

Lower temperature $(\mathrm{K})=$ $\qquad$

Average of three lower temperature solubilities $=$ $\qquad$ from Goal \#2
$\boldsymbol{K}_{\mathbf{s p}}=4(\text { solubility })^{3}=$ $\qquad$ where solubility $=$ average lower temp. solubility
$\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{K}_{\mathrm{sp}}=$ $\qquad$ ( $\mathrm{kJ} / \mathrm{mol}$ )
Use $R=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$, $T=$ Kelvin temp., Ksp = answer on previous line Convert J to $k J$ to get the final answer

Show examples of how this work was accomplished

## Goal \#3: Continued

At higher temperature:
Higher temperature $\left({ }^{\circ} \mathrm{C}\right)=$ $\qquad$ from Goal \#1

Higher temperature $(\mathrm{K})=$ $\qquad$

Average of three higher temperature solubilities $=$ $\qquad$ from Goal \#2
$\boldsymbol{K}_{\text {sp }}=4(\text { solubility })^{3}=$ $\qquad$ where solubility $=$ average high temp. solubility

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{~K}_{\mathrm{sp}}=
$$

Use $R=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$, $T=$ Kelvin temp., Ksp = answer on previous line Convert J to $k J$ to get the final answer

Show examples of how this work was accomplished

Goal \#4: Use the values of $\Delta \mathbf{G}^{\circ}$ and $\mathbf{T}$ to find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$. We will use the $\Delta G^{\circ}$ and Kelvin temperatures to find $\Delta H^{\circ}$ and $\Delta S^{\circ}$ using the Gibbs Equation, $\Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ}$ From Goal \#3:

Lower temperature $(\mathrm{K})=$ $\qquad$

$$
\Delta \mathrm{G}^{\circ}=\ldots(\mathrm{kJ} / \mathrm{mol})
$$

Higher temperature $(\mathrm{K})=$ $\qquad$

$$
\Delta \mathrm{G}^{\circ}=\ldots(\mathrm{kJ} / \mathrm{mol})
$$

Find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ in the space below. Clearly show your work for full credit.
$\Delta \mathrm{H}^{\circ}=$ $\qquad$ ( $\mathrm{kJ} / \mathrm{mol}$ )
$\Delta S^{\circ}=$ $\qquad$ (kJ/mol)

## Postlab Questions:

1. A 10.00 mL sample of $\mathrm{Ba}(\mathrm{OH})_{2}$ at $0 .{ }^{\circ} \mathrm{C}$ is titrated with 0.2500 M HCl , and 4.80 mL of the acid are used to reach the yellow endpoint.
a. Calculate the concentration of hydroxide in the $\mathrm{Ba}(\mathrm{OH})_{2}$ solution.
b. Determine the molar solubility and $K_{\text {sp }}$ of $\mathrm{Ba}(\mathrm{OH})_{2}$.
c. Calculate $\Delta \mathrm{G}^{\circ}$ for this reaction using the value of $K_{\text {sp }}$.
2. A second 10.00 mL sample of $\mathrm{Ba}(\mathrm{OH})_{2}$ is obtained at a temperature of $50 .{ }^{\circ} \mathrm{C}$. This solution is titrated with 44.15 mL of 0.2500 M HCl to reach the yellow endpoint.
a. Calculate the concentration of hydroxide in this $\mathrm{Ba}(\mathrm{OH})_{2}$ solution.
b. Determine the molar solubility and $K_{\text {sp }}$.
c. Calculate $\Delta \mathrm{G}^{\circ}$ for this reaction using the value of $K_{\text {sp }}$.
3. Using the values of $\Delta \mathrm{G}^{\circ}$ at $0 .{ }^{\circ} \mathrm{C}$ and $50 .{ }^{\circ} \mathrm{C}$, calculate $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for this reaction.

## Postlab Questions: Continued

4. Look up and report the value of $\mathrm{K}_{\text {sp }}$ for calcium hydroxide at $25^{\circ} \mathrm{C}$ in your textbook or on the internet. How does your room temperature ("lower temperature") value compare to the reference? What are the sources of error? Cite your reference for the $\mathrm{K}_{\text {sp }}$ value.
5. Calculate the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ at $50^{\circ} \mathrm{C}$ using your experimental values of $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$. (Hint: First find $\Delta \mathrm{G}^{\circ}$ at the new temperature, then determine Ksp and finally solubility.) Is this solubility the average of the $0{ }^{\circ} \mathrm{C}$ and $100{ }^{\circ} \mathrm{C}$ solubilities? Why or why not? (Hint: are the equations used to determine solubility linear?)

# CH 223 Spring 2024: <br> "Qualitative Analysis of <br> Group I Cations" (in class) Lab: Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of CH 223 only.

- If you are taking section W1 of CH 223, please use this link:
http://mhchem.org/q/8b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-8-2 through Ia-8-7 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2 -point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, May 20 (section 01) or Wednesday, May 22 (section H1.) During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

Step Three:
Complete the lab work and calculations on your own, then turn it in (page Ia-8-7 only to avoid a point penalty) to the instructor on Wednesday, May 29 at 9 AM in AC 1303 (section 01) or Wednesday, May 29 at 1:10 PM in AC 2501 (section H1.)

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Qualitative Analysis Of Group I Cations

In previous labs you have determined the amount of an unknown species present, such as percent chloride, identification of an unknown copper, and the molarity of various acid and base solutions. These experiments are a part of chemistry called quantitative analysis. When a chemist performs a qualitative analysis of a sample, $\mathrm{s} / \mathrm{he}$ is more interested in the nature of the species present in a sample rather than the amount.

A set of experiments can be performed on an unknown mixture to precipitate cations in a sequential order. Under specific conditions, if a precipitate contains only one cation, the presence of that cation can be determined. Various types of reactions can be performed to separate the ions, including acid-base, complex ion formation, redox and other precipitation reactions. Ultimately, the sample should be resolved into fractions each containing one cation, whose presence is established by the formation of a characteristic precipitate or colored complex ion. The first step is to develop a scheme for the separation and identification of the cations.

Cations are typically divided into Groups, where each group shares a common reagent that can be used for selective precipitation. The classic qualitative analysis scheme used to separate various groups of cations is shown in the flow chart on the next page.

Over the next several weeks, you will study group I and III cations. You will develop a scheme to determine the cations present in an unknown mixture. Finally, you will carry out this scheme.

## Precipitation and Separation of Group I Cations:

$\mathbf{P b}^{+\mathbf{2}}, \mathbf{H g}_{2}{ }^{\mathbf{+ 2}}$, and $\mathbf{A g}^{+}$are all insoluble in cold water. They can be removed as a group from solution by the addition of HCl via simple precipitation in the following net ionic reaction:

$$
\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \rightarrow \mathrm{AgCl}(\mathrm{~s})
$$

It is important to add enough HCl to ensure complete precipitation, but not too large an excess. In highly concentrated HCl solutions, chloro-complexes may form such as $\mathrm{AgCl}_{2}{ }^{-1}$.

Lead chloride can be separated from AgCl and $\mathrm{Hg}_{2} \mathrm{Cl}_{2}$ by heating with water, essentially reversing the above reaction. Once $\mathrm{Pb}^{+2}$ is in solution, you can discern its presence by adding chromate ion to produce a yellow solid:

$$
\mathrm{Pb}^{+2}(\mathrm{aq})+\mathrm{CrO}_{4}^{-2}(\mathrm{aq}) \rightarrow \mathrm{PbCrO}_{4}(\text { yellow solid })
$$

$\mathbf{H g}_{2} \mathbf{C l}_{2}$ can be distinguished from AgCl by reaction with ammonia via oxidation reduction to yield finely divided black metallic mercury and a white complex compound $\mathrm{HgNH}_{2} \mathrm{Cl}$. As the reaction proceeds, the solid appears to change colors from white to black or gray:

$$
\mathrm{Hg}_{2} \mathrm{Cl}_{2} \text { (white solid) }+2 \mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{NH}_{4}+(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq})+\mathrm{Hg}(\text { black liquid })+\mathrm{HgNH}_{2} \mathrm{Cl} \text { (white solid) }
$$

Silver chloride also reacts with aqueous ammonia to form a complex ion that remains in solution. Addition of a strong acid will destroy the complex and confirm the presence of silver ion by re-precipitating the white AgCl solid:

$$
\begin{gathered}
\mathrm{AgCl}(\mathrm{~s})+2 \mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq}) \\
\left.\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right)^{+}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq}) \rightarrow \mathrm{AgCl}(\mathrm{~s})+2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})
\end{gathered}
$$

SOLUTION OF CATIONS, GROUPS 1-5

As you can see from the chart above, there are many Cation Groups.
We will analyze Group I Cations (the "Silver group") and some of the Group III Cations.

Laboratory Techniques: Above all else, you must wear safety glasses at all times while performing Qualitative Analysis labs! Failure to bring your own pair of safety glasses will result in a point penalty. Glasses must be worn over prescription glasses on these labs.

## Attire in the Lab:

Please do not wear open toed shoes or sandals; shorts and shirts that show mid-riff areas are disallowed. You will be sent home to change if proper attire is not worn, so please, think safe when dressing for lab!

## Waste:

Make sure all waste is placed in a proper waste container - do not pour anything down the drain.

## Cleanliness:

Make sure that all test tubes, stirring rods, etc. are clean. Rinse all equipment with water before and after use. Use clean droppers.

## Centrifuging:

Use centrifuge tubes when centrifuging - do not use ordinary test tubes. A tube of approximately the same mass and volume in the opposite slot of the centrifuge must be used to balance the centrifuge. Generally centrifuging for a minute or less is sufficient for these labs.

## Decanting:

After centrifuging, the supernatant (the liquid above a precipitate; it is also called the decantate) is usually decanted (poured) into a clean test tube with the intent of keeping the solid in the original container. Carefully tip the test tube and pour off the supernatant without disturbing the solid. It may be poured directly, or a stirring rod may be placed across the mouth of the test tube to direct the supernatant into a clean test tube.

## Washing a Precipitate:

After separation from the supernatant, a precipitate is often washed to free it from reagents that might interfere at a later stage. Usually, the rinse is deionized water, but other liquids or solutions may be used. After thorough stirring, centrifuge the sample and decant the wash solution.

## Heating:

Due to the small quantity of material being heated, solutions in test tubes can reach its boiling point within a few seconds, and chemicals may be ejected violently from the container. If the solution volume is too large to fit in a centrifuge tube, reducing the volume can be accomplished by placing the solution in a 30 mL beaker and placing it on the hot plate. Watch the solution on the hot plate intently - if overheated, you may be left with a crusty remnant which is hard to reconstitute. Using a water bath is safer, but slower.

## Testing pH:

When directed to check the pH of a solution, stir the solution thoroughly with a clean glass stirring rod and then touch the tip of the rod to a piece of litmus paper. Several such tests may be performed on each strip of paper. Red litmus paper will turn blue in basic solutions; blue litmus paper will turn red in acidic solutions.

## Flow Charts:

It is possible to summarize the directions for the analysis of the Group I cations in a flow chart. In a flowchart, successive steps in the procedure are linked with arrows or lines. Reactant cations are at one end of the line; reagents and conditions used to carry out each step are placed alongside the lines. The line splits to show the two possible outcomes (yellow ppt $=\mathrm{Pb}^{+2}$ present; no $\mathrm{ppt}=$ absence). A flow chart for the separation of Group I cations should be included in your lab report.

A partially completed flowchart for the Group I Cations lab is included below. When you complete a flowchart, make sure that it shows clearly where each cation is separated out; also show the confirmation of each cation (with both yes and no options to indicate the presence or absence of the cation.)

Flowcharts may be completed on paper by hand or electronically on the computer; the choice is yours.

## Unknown Solution

PROCEDURE: All waste must go in a waste bottle. Safety glasses are mandatory for everyone; no open toed shoes or sandals, no shorts or mid-riff showing shirts.

## Step 1: Preparation:

Prepare a 1 mL "known" sample by placing 7 drops of each of the following into a centrifuge tube: 0.1 M $\mathrm{AgNO}_{3}, 0.3 \mathrm{M} \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and $0.1 \mathrm{M} \mathrm{Hg}_{2}\left(\mathrm{NO}_{3}\right)_{2}$. Prepare a second 1 mL "unknown" sample using 1 mL of your unknown liquid. Be sure to write the identity of your unknown. Your unknown will have between one and three of the Group I cations in it, and the known will act as a "control" to see appropriate color changes, etc. throughout the tests.

You will perform the following tests upon each solution (both the known and unknown solutions) simultaneously. Be sure to write down any color changes, precipitates, etc. that you might observe in your lab notebook.

## Step 2: Precipitation of Group I Cations:

Add two drops of 6 M HCl and mix with a clean stirring rod. Centrifuge the mixture being certain a centrifuge tube of equal volume is placed opposite your centrifuge tube as a balance. Add one more drop of 6 M HCl to the test tube to be certain of complete precipitation. Centrifuge again if necessary. Decant the supernatant into another test tube and save for later analysis for Group III cations (if appropriate, i.e. on the Final Lab). The precipitate should be white and contain the chlorides of the Group I cations.

## Step 3: Separation and ID of Lead:

Rinse the precipitate from Step 2 with $1-2 \mathrm{~mL}$ of deionized water. Stir, centrifuge and discard the liquid. Add 2 mL deionized water and place in boiling water for two minutes, stirring occasionally to dissolve most of the $\mathrm{PbCl}_{2}$. Centrifuge and decant the liquid into another test tube. Save the precipitate for later tests for silver and mercury.

Add one drop of 6 M acetic acid and two drops of $1 \mathrm{M} \mathrm{K}_{2} \mathrm{CrO}_{4}$ to the liquid. A bright yellow precipitate will appear if the lead (II) ion is present.

## Step 4: Separation and ID of Mercury:

To the precipitate from step 3, add $1 \mathrm{~mL}^{6} \mathrm{M} \mathrm{NH}_{3}$ and stir. Centrifuge and decant the liquid into a test tube for testing for $\mathrm{Ag}^{+}$(Step 5.) A gray or black precipitate confirms the presence of the mercury(I) ion.

## Step 5: Identification of Silver:

Add $6 \mathrm{M} \mathrm{HNO}_{3}$ to the liquid from step 4 until it is acidic to litmus. Test for acidity by touching the end of your stir rod to litmus paper. If $\mathrm{Ag}^{+}$is present, it will precipitate in the acidified solution as white AgCl .

## Step 6: Cleanup!

Please rinse all glassware and equipment prior to leaving lab. Return cleaned centrifuge tubes to the container without masking tape.

Include answers to the following postlab questions (most of which can be found on the introductory page for this lab, hint, hint () ).

# Qualitative Analysis of Group I Cations Lab - Worksheet 

$\qquad$
$\qquad$

## Unknown Number:

$\qquad$

Circle either yes or no for each metal cation in your unknown.

$$
\begin{array}{ccc}
\mathbf{P b}^{2+}: & \text { yes } & \text { no } \\
& & \\
\mathbf{H g}_{2}{ }^{2+}: & \text { yes } & \text { no } \\
& & \\
\mathbf{A g}^{+}: & \text {yes } & \text { no }
\end{array}
$$

Include a flowchart showing the overall steps used to separate the Group I cations with your lab report.

## Postlab Questions:

1. Write balanced net ionic equations for the following reactions:
a. The precipitation reaction of the chloride of $\mathrm{Hg}_{2}{ }^{+2}$ in step 2 .
b. The formation of the yellow precipitate in step 3 .
c. The formation of the black precipitate in step 4 .
d. The reaction that occurs in step 5 .

## This page left blank for printing purposes

# CH 223 Spring 2024: "Qualitative Analysis of Group III Cations" (in class) Lab: Instructions 

Note: This is the lab for section 01 and $\mathbf{H 1}$ of $\mathbf{C H} 223$ only.

- If you are taking section W1 of CH 223, please use this link:

> http://mhchem.org/q/9b.htm

Step One:
Get a printed copy of this lab! You will need a printed (hard copy) version of pages Ia-9-2 through Ia-9-5 to complete this lab. If you do not turn in a printed copy of the lab, there will be a 2-point deduction.

Step Two:
Bring the printed copy of the lab with you on Monday, June 3 (section 01) or Wednesday, June 5 (section H1). During lab in room AC 2507, you will use these sheets (with the valuable instructions!) to gather data, all of which will be recorded in the printed pages below.

## Step Three:

Complete the lab work, then turn it in (page Ia-9-5 only to avoid a point penalty) at the END OF LAB to the instructor on Monday, June 3 (section 01) or Wednesday, June 5 (section H1.)

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Qualitative Analysis Of Group III Cations

The four group III cations in this lab are $\mathbf{C r}^{\mathbf{+ 3}}, \mathbf{A l}^{\mathbf{+ 3}}, \mathbf{F e}^{\mathbf{+ 3}}$, and $\mathbf{N i}^{\mathbf{+ 2}}$. The first step in analysis involves separating the ions into two subgroups by treating the solution with NaOH and NaOCl . The hypochlorite ion oxidizes $\mathrm{Cr}(\mathrm{III})$ to a higher, more stable oxidation state (namely $\mathrm{Cr}(\mathrm{VI})$ ) which is soluble:

$$
2 \mathrm{Cr}^{+3}(\mathrm{aq})+3 \mathrm{OCl}^{-1}(\mathrm{aq})+10 \mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow 2 \mathrm{CrO}_{4}^{-2}(\mathrm{aq})+3 \mathrm{Cl}^{-1}(\mathrm{aq})+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

In addition, $\mathrm{Al}^{+3}$ forms a soluble hydroxo-complex ion in the presence of excess hydroxide:

$$
\mathrm{Al}^{+3}(\mathrm{aq})+4 \mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Al}(\mathrm{OH})_{4^{-1}}(\mathrm{aq})
$$

In contrast, $\mathrm{Ni}^{+2}$ and $\mathrm{Fe}^{+3}$ do not readily form hydroxo-complexes and are not oxidized by hypochlorite. They form insoluble hydroxides under these conditions:

$$
\begin{gathered}
\mathrm{Ni}^{+2}(\mathrm{aq})+2 \mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Ni}(\mathrm{OH})_{2}(\text { green solid }) \\
\mathrm{Fe}^{+3}(\mathrm{aq})+3 \mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{OH})_{3}(\text { red solid })
\end{gathered}
$$

To separate aluminum from chromium, the solution containing $\mathrm{CrO}_{4}{ }^{-2}$ and $\mathrm{Al}(\mathrm{OH})_{4}{ }^{-}$is acidified to destroy the hydroxo-complex:

$$
\mathrm{Al}(\mathrm{OH}) 4^{-1}(\mathrm{aq})+4 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Al}^{+3}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

Treatment with aqueous ammonia gives a gelatinous white precipitate of aluminum hydroxide. The concentration of hydroxide in ammonia is too low to form the hydroxo-complex:

$$
\mathrm{Al}^{+3}(\mathrm{aq})+3 \mathrm{NH}_{3}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow 3 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{Al}(\mathrm{OH})_{3}(\text { white solid })
$$

The chromate ion remains in solution. It can be tested and confirmed by precipitation as yellow $\mathrm{BaCrO}_{4}$ :

$$
\mathrm{Ba}^{+2}(\mathrm{aq})+\mathrm{CrO}_{4}^{-2}(\mathrm{aq}) \rightarrow \mathrm{BaCrO}_{4}(\text { yellow solid })
$$

The $\mathrm{BaCrO}_{4}$ precipitate dissolves in acid. The solution is then treated with $\mathrm{H}_{2} \mathrm{O}_{2}$ to produce a deep blue color due to the presence of a peroxo-compound, probably $\mathrm{CrO}_{5}$ :

$$
2 \mathrm{BaCrO}_{4}(\mathrm{~s})+4 \mathrm{H}^{+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{Ba}^{+2}(\mathrm{aq})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{CrO}_{5}(\mathrm{blue}, \mathrm{aq})
$$

The mixed precipitate of $\mathrm{Ni}(\mathrm{OH})_{2}$ and $\mathrm{Fe}(\mathrm{OH})_{3}$ can be dissolved by adding a strong acid. The $\mathrm{Ni}^{+2}$ and $\mathrm{Fe}^{+3}$ ions can be separated by adding ammonia. $\mathrm{Ni}^{+2}$ is converted to the deep-blue complex $\mathrm{Ni}\left(\mathrm{NH}_{3}\right)_{6}{ }^{+2}$ which stays in solution. The $\mathrm{Fe}^{+3}$ ion does not readily form a complex and re-precipitates as $\mathrm{Fe}(\mathrm{OH})_{3}$ :

$$
\begin{aligned}
\mathrm{Ni}^{+2}(\mathrm{aq})+6 \mathrm{NH}_{3}(\mathrm{aq}) & \rightarrow \mathrm{Ni}\left(\mathrm{NH}_{3}\right)_{6}+2(\mathrm{blue}, \mathrm{aq}) \\
\mathrm{Fe}^{+3}(\mathrm{aq})+3 \mathrm{NH}_{3}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) & \rightarrow 3 \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{Fe}(\mathrm{OH})_{3}(\text { red solid })
\end{aligned}
$$

Confirm the presence of $\mathrm{Ni}^{+2}$ by adding dimethylglyoxime (DMG), $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}$, to give a deep rose precipitate:

$$
\mathrm{Ni}^{+2}(\mathrm{aq})+2 \mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Ni}\left(\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{~N}_{2} \mathrm{O}_{2}\right)_{2} \text { (red solid) }
$$

Confirm the presence of $\mathrm{Fe}^{+3}$ by dissolving $\mathrm{Fe}(\mathrm{OH})_{3}$ in a strong acid and adding KSCN to form a blood-red $\mathrm{FeSCN}^{+2}$ complex ion:

$$
\mathrm{Fe}^{+3}(\mathrm{aq})+\mathrm{SCN}-(\mathrm{aq}) \rightarrow \mathrm{FeSCN}^{+2}(\mathrm{red}, \mathrm{aq})
$$

PROCEDURE: Safety glasses required for everyone, all the time - no open toed shoes or sandals, no shorts or mid-riff showing shirts. This can be a longer lab, so come prepared and organized to maximize your lab experience.

Step 1: Preparation: If you are working on the analysis of only group III ions, prepare a known solution by mixing 5-6 drops each of 0.1 M solutions of $\mathrm{Fe}^{+3}, \mathrm{Al}^{+3}, \mathrm{Cr}^{+3}$, and $\mathrm{Ni}^{+2}$ in a 30 mL beaker. Also obtain an unknown to analyze at the same time for the presence of group III cations and use about 20-24 drops in your analysis.

Step 2: Oxidation of $\mathbf{C r}(\mathbf{I I I})$ to $\mathbf{C r}(\mathbf{V I})$ and Separation of Insoluble Hydroxides: Add 1 mL of 6 M NaOH to the solution in a 30 mL beaker. Boil very gently for 1 minute while stirring. Remove heat and slowly add dropwise 1 mL of 1 M NaClO . Swirl the beaker for 30 seconds, using tongs if necessary. Boil the mixture for 1 minute. Centrifuge. Transfer the supernatant (which contains the aluminum and chromate) to a separate tube. Wash the precipitate (which contains iron and nickel hydroxides) with 2 mL water and 0.5 mL of 6 M NaOH : stir, centrifuge, decant and discard the wash. Add 1 mL of water and 1 mL of $6 \mathrm{M} \mathrm{HNO}_{3}$ to the solid and put it aside until step 6.

Step 3: Separation of Al from Cr: Acidify the solution from step 2 by adding 6 M acetic acid in $\mathbf{2 . 0} \mathbf{~ m L}$ increments until, after stirring, the mixture is definitely acidic to litmus (it might take up to 30 mL or more.) If necessary, transfer the solution to a 30 mL beaker and boil it to reduce its volume to about 3 mL . Pour the solution into a test tube. Add $6 \mathrm{M} \mathrm{NH}_{3}$ in 5 drop increments until the solution is basic to litmus; and then add 0.5 mL excess. Stir the mixture for one minute to bring the system to equilibrium. If aluminum is present, a light, translucent gelatinous white precipitate of $\mathrm{Al}(\mathrm{OH})_{3}$ may be floating in the clear to yellow solution. Centrifuge and transfer the liquid (which contains $\mathrm{CrO}_{4}^{-2}$ ) to another test tube.

Step 4: Confirmation of the Presence of Aluminum: Wash the precipitate from step 3 with 3 mL water, warming the test tube in the water bath and stirring well. Centrifuge and discard the wash. Dissolve the precipitate in 2 drops of $6 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ (no more, no less!). Add 3 mL of water and 1-2 drops of aluminon. Stir. If $\mathrm{Al}^{+3}$ is present, the solution will turn a lovely rose-pink color due to the presence of a very fine red or pink precipitate.

Step 5: Confirmation of the Presence of Chromium: A yellow liquid from step 3 suggests but does not confirm the presence of chromium. To the solution add 0.5 mL of $1.0 \mathrm{M} \mathrm{BaCl}_{2}$. In the presence of chromium a finely divided yellow precipitate of $\mathrm{BaCrO}_{4}$ appears. Put the test tube in boiling water for two minutes. Centrifuge and discard the liquid. Wash the solid with 2 mL of water, centrifuge and discard the wash. To the solid add 0.5 mL of $6 \mathrm{M} \mathrm{HNO}_{3}$. Stir to dissolve $\mathrm{BaCrO}_{4}$. Add 1 mL of water, stir the orange solution. Add 2 drops of $3 \% \mathrm{H}_{2} \mathrm{O}_{2}$. A deep blue solution, which may fade rapidly, confirms the presence of chromium.

Step 6: Separation of Iron and Nickel: Returning to the precipitate from step 2, stir to dissolve the solid in the $\mathrm{HNO}_{3}$. If necessary, warm the test tube in the water bath to completely dissolve the solid. Add $6 \mathrm{M} \mathrm{NH}_{3}$ until the solution is basic to litmus. At this point, iron will precipitate as brown $\mathrm{Fe}(\mathrm{OH})_{3}$. Add 1 mL more of the $\mathrm{NH}_{3}$ and stir to bring the nickel into solution as the $\mathrm{Ni}\left(\mathrm{NH}_{3}\right)_{6}+2$ ion. Centrifuge and decant the liquid into a test tube. Save the precipitate for step 8 to test for the presence of iron.

Step 7: Confirmation of the Presence of Nickel: If the solution from step 6 is blue, nickel may be present. To the solution add 0.5 mL dimethylglyoxime (DMG) reagent. Formation of a rose-red precipitate proves the presence of nickel.

Step 8: Confirmation of the Presence of Iron: Dissolve the precipitate from step 6 in 0.5 mL of 6 M HCl . Add 2 mL water and stir. Add 2 drops of 1.0 M KSCN . Iron is present if a deep red solution of $\mathrm{FeSCN}^{+2}$ is formed.

Step 9: Cleanup! Please rinse all glassware and equipment prior to leaving lab. Return cleaned centrifuge tubes to the container without masking tape.

Make sure you include your unknown number or letter!
Answers to the postlab questions can mostly be found on the main page of this lab, hint, hint $\odot$.

# Qualitative Analysis of Group III Cations Lab - Worksheet 

YOUR NAME: $\qquad$
$\qquad$

Unknown Number: $\qquad$
Circle either yes or no for each metal cation in your unknown.
$\mathbf{F e}^{3+}$ : yes no
$\mathbf{N i}^{\mathbf{2}}$ : yes no
$\mathbf{C r}^{3+}$ : yes no
$\mathbf{A l}^{3+}$ : yes no

## Postlab Questions:

1. Write balanced net ionic equations for the following reactions:
a. Dissolving $\mathrm{Fe}(\mathrm{OH})_{3}$ in nitric acid
b. Oxidation of $\mathrm{Cr}(\mathrm{III})$ by hypochlorite ion in base.
c. The confirmatory test for $\mathrm{Ni}^{+2}$. (Step 7)
d. The confirmatory test for $\mathrm{Fe}^{+3}$. (Step 8)

# "Introduce Yourself"' Lab for Chemistry 223 Section W1 <br> Create a video, sign the form below and turn in via email to mike.russell@mhcc.edu by 9 AM, Friday, April 5. Remember to turn in the video link to me as well! 

## Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section Hl of CH 223 , please use this link: http://mhchem.org/q/1a.htm

Welcome to Chemistry 223! I am glad you enrolled in CH 223 this quarter, and I look forward to an exciting term with you!

This class will be quite different from previous Chemistry 223 classes taught at Mt. Hood Community College... it will be taught exclusively online; there will be no "face to face" lectures, labs, office hours, exams, etc. So.... let's make the best of it, ok? :)

The goal of this "lab" is to "meet you." I want to know a bit about you, so I want you to make a short (about 3 minutes or so) video (preferably on YouTube or something similar) about yourself. Show yourself talking (no pictures, etc. - just show you!) and tell me a bit about yourself. Maybe you could tell me about your college goals - why are you taking CH 223? Or maybe you could tell me about a cool movie you watched, or a book you read, or a music band you're enjoying.... it's totally up to you, but it will help me get a better idea as to "who you are", and this is important to me! Email me a link to the video.

I also want you to read the "Memorandum" page (which is found below), then initial, sign and return the "Memorandum" page to me electronically (i.e. email to mike.russell@mhcc.edu).

I have suggestions for completing both assignments on the next several pages.

## How to Create a Video for this Assignment:

Making a video should not be a difficult assignment for you. I do not expect a "Hollywood quality" video; instead, I just want to see YOU and hear some of your stories. This MUST be an original and current video - do not re-use a video made from a previous class.

To create the video, I recommend creating a video on your phone, then using the YouTube app to upload the video. Connect your gmail/Google account in YouTube, select the "plus" symbol (which is at the bottom middle of the screen) to start uploading the video (and make sure you set the video to "unlisted", not "private".) Once ready, email me a link (use the "Share" - "Copy Link" function)... and then you're done!

You do not have to edit your video - it can be pretty rough! And if you don't like your video, record a new version and start again.

## How to Fill Ou the "Memorandum" for this Assignment:

The final page of this assignment has the "Memorandum" which I also want you to submit to me via email. All assignments must be submitted to the instructor via email (mike.russell@mhcc.edu) this quarter, and only in one file (i.e. if the assignment is five pages, submit all five pages as one file and not five individual files.)

How you do this depends on you... here are some suggestions:

## 1 - If you have a printer and wish to complete the work "by hand".

- print the assignment and fill out as usual. You cannot print at MHCC currently (hopefully this will change soon) so this must be done on your own.
- On your phone (Android or iPhone), use a free program like CamScammer to make pdf scans and combine into one file. Alternatively you can use CombinePDF (https://combinepdf.com) to automatically convert multiple picture (.jpg or .png) files into a single PDF file. These services should be free - do not pay for any upgrades or extras!
- Email the PDF to the instructor! done! (and again, I really like CamScanner!)

## 2 - If you have a tablet (iPad, Surface, etc.) and can write directly on the screen:

- Download the PDF file (to the desktop, Google Drive, etc.)
- Use a program which allows you to import the PDF and write directly on the tablet. Examples include (but are not limited to): GoodNotes (my current favorite), Notability, Apple Notes, Evernote, Google Keep, Typora or Microsoft OneNote Some of these programs might have a cost associated with them.
- Email the completed PDF assignment to the instructor... you're done!

3 - If you wish to complete assignments in Microsoft Word: (Note: as a MHCC student, you can access Microsoft Office for free on both Windows and Mac platforms. More info: https:// mhcc.edu/OfficeInstall/)

- Open the PDF file in Word. Modern versions of Word will convert the file for you so you can complete the work within the Word program.
- To Save your work as a PDF:
- On Mac: File -> Print -> PDF -> Save as PDF
- In Windows (Windows 10): File -> Print -> Microsoft Print to PDF (More info for Windows users: https://www.howtogeek.com/361612/how-to-create-a-pdf-file-inwindows/ )
- Email the completed PDF assignment to the instructor... you're done!

Please note that the formatting of the original PDF file does not have to be maintained. Using Word files can alter the formatting.... but as long as the question order is maintained, and I can see which question you're answering, etc. all will be well.

## 4 - If you wish to complete assignments in Google Documents:

- Save the assignment to your Google Drive.
- Right click/Control click on the PDF file, then Open with Google Docs
- Complete the assignment
- To Save your work as a PDF file:
- On Mac: File -> Print -> Print from my Computer, then File -> Print -> PDF -> Save as PDF
- In Windows: File -> Download -> PDF Document (.pdf)
- Email the completed PDF assignment to the instructor... you're done!

Please note that the formatting of the original PDF file does not have to be maintained. Using Google Doc files can alter the formatting.... but as long as the question order is maintained, and I can see which question you're answering, etc. all will be well.

## Again, you pick which of these methods works well for you, and use it complete all assignments in CH 223 this quarter.

And if you have questions on anything, please email me (mike.russell@mhcc.edu) - I'm happy to help!

Good luck, and I look forward to having you in my classroom this quarter!

Peace, Michael
p.s. Want to know more about me? https://mhchem.org/221/russellm/index.htm

## Memorandum for Chemistry 223 Section W1

Create a video, sign the form below and turn in everything via email to mike.russell@mhcc.edu by 9 AM, Friday, April 5.
Also remember to turn in the video link to me as well!

* Please note: if you plan on taking Organic Chemistry in the future, you really should sign up for Section 01 or Section H1 of CH 223. You will be missing out on essential lab skills and procedures which will be missed if you take Organic Chemistry. Email me if you have questions, I might be able to switch you to Section 01 or Section H1 this term.
* I, the undersigned, agree to turn in all assignments via email only using PDF, Word/Excel files, and Google shared documents. All assignments will be submitted as a single file (do not submit one assignment as multiple files.) This class will be taught exclusively online, and there will be no face-to-face office hours, labs, lectures, quizzes, exams, etc.
* I understand that problem sets and labs are due on Wednesdays by 11:59 PM via email and quizzes and exams are due on Friday at 9 AM via email, and late assignments (even due to technology reasons) will incur a point penalty. Quizzes and exams will be worth zero points if turned in late. Email assignments early if you worry about the quality of your internet connection.
* I understand that all assignments will be returned via email to the email address listed below. This address will be used to discus items related to our class during the term. The email address I include below can be shown to other students in a public CH 223 email message.
* I will try to have a sense of humor as the instructor frantically tries to keep up with the changes of this class :). I will email the instructor if I have any questions!
* I have read this document and will stay informed with the class through the instructor's email.

## CH 223 Spring 2024: "Determination of an <br> Equilibrium Constant (online)" Lab-Instructions

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section H 1 of CH 223 , please use this link:
http://mhchem.org/q/2a.htm
Step One:
Watch the lab video for the "Equilibrium Constant" lab, found here:
http://mhchem.org/v/a.htm
Record the data found at the end of the lab video on page Ib-2-7.
Step Two:
Complete pages Ib-2-7 through Ib-2-14 using the "Equilibrium Constant" video and the actual lab instructions on pages Ib-2-2 through Ib-2-6. Include your name on page Ib-2-7!

Step Three:

Submit your lab (pages $\mathrm{Ib}-2-7$ through $\mathrm{Ib}-2-14$ only to avoid a point penalty) and computer generated graph as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, April 10 by 11:59 PM. I recommend a free program (ex: CamScanner, https://camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Determination Of An Equilibrium Constant

In this experiment the equilibrium properties of the reaction between the iron(III) ion and the thiocyanate ion will be studied. The relevant chemical equation for this lab is:

$$
\mathrm{Fe}_{(\mathrm{aq})}^{+3}+\mathrm{SCN}_{(\mathrm{aq})} \rightleftharpoons \mathrm{FeSCN}^{+2}(\mathrm{aq})
$$

$$
\mathrm{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

When solutions of $\mathrm{Fe}^{+3}$ and SCN - are mixed, the above reaction occurs to some extent, forming the complex ion $\mathrm{FeSCN}^{+2}$. The concentrations of $\mathrm{Fe}^{+3}$ and SCN - will decrease by one mole for every mole of $\mathrm{FeSCN}^{+2}$ that forms, but not all of the $\mathrm{Fe}^{3+}$ and SCN - ions will be converted to the complex ion under normal circumstances.

The objective of this experiment is to determine the equilibrium constant, $\mathbf{K}_{\mathbf{c}}$, for this reaction. The value of $\mathrm{K}_{\mathrm{c}}$ is constant at a given temperature. Any mixture of $\mathrm{Fe}^{+3}$ and SCN - will react until the same value of $\mathrm{K}_{\mathrm{c}}$ is obtained. In this experiment, we will determine $\mathrm{K}_{\mathrm{c}}$ for this reaction using several different mixtures of $\mathrm{Fe}^{+3}$ and SCN-

Before we can calculate the value of the equilibrium constant, we must be able to determine the concentration of $\mathrm{FeSCN}^{+2}$ in solution. The Beer-Lambert Law, which is commonly referred to as simply Beer's Law, relates the absorption of light in a colored sample to its concentration in solution:

$$
A=\varepsilon b c=\log (100 \% / \% T)
$$

Here $\mathbf{A}$ is the measured absorbance of the colored solution, $\varepsilon$ is the molar absorptivity (with units of $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ), $\mathbf{b}$ is the path length (in cm ), and $\mathbf{c}$ is the concentration (molarity, or moles per Liter) of the species being studied, in this case $\mathrm{FeSCN}^{+2}$. The value of the molar absorptivity, $\varepsilon$, depends on the solute's overall energy stored within the molecule. $\mathrm{FeSCN}^{2+}$ has a deep red color while the reactants are virtually colorless, and only $\mathrm{FeSCN}^{2+}$ will absorb light in the visible region.

Absorbance is a unitless quantity that corresponds with the amount of light removed by a colored system. Depending on if you use an analog Spectronic 21 or a digital Vernier SpectroVis, you may need to measure the percent transmittance (\%T), or how much light gets through colored solutions. Calculating absorbance from $\% \mathrm{~T}$ is straightforward $(\mathrm{A}=\log (100 \% / \% \mathrm{~T})$.

Because $\mathrm{FeSCN}^{+2}$ has a red color, we will use a wavelength appropriate for measuring red light - the SpectroVis will tell us what the exact wavelength will be, but it should be about 450 nm (which is what you'll use when utilizing the Spectronic 21.) Using the Beer's Law equation, we can determine the molar absorptivity constant, $\varepsilon$, for $\mathrm{FeSCN}^{+2}$ by measuring its absorbance at different known concentrations of $\mathrm{FeSCN}^{2+}$. If absorbance is plotted versus concentration, the slope will give the molar absorptivity constant using Beer's Law.

Finding the concentration of $\mathrm{FeSCN}^{+2}$ can be achieved using Le Chatelier's Principle. If an excess of $\mathrm{Fe}^{3+}$ is added to a small amount of SCN -, one can assume that the amount of SCN - present in solution equals the amount of $\mathrm{FeSCN}^{2+}$ formed at equilibrium. In other words, we know the final concentration of $\mathrm{FeSCN}^{+2}$ in the solution by creating a solution that is not in equilibrium but goes to completion using the principle of limiting reagent. The SCN - will be completely converted to $\mathrm{FeSCN}^{+2}$, such that the final concentration of $\mathrm{FeSCN}^{+2}$ is equal to the initial concentration of SCN -

The purpose of this lab is to find the value of the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$. First, you will prepare a series of
solutions with known concentrations of $\mathrm{FeSCN}^{2+}$ (or SCN -) and measure the absorbance (or percent transmittance) values at a wavelength appropriate for a red solution around 450 nm . When the absorbance values are plotted versus the concentration of $\mathrm{FeSCN}^{2+}$, a linear relationship appears, and $\varepsilon$ can be calculated using linear regression (the slope equals $\varepsilon b$.). Remember to report the value of the slope, y-intercept and correlation coefficient when using linear regression. $\varepsilon$ will allow you to calculate the concentration of $\mathrm{FeSCN}^{2+}$ for any combination of $\mathrm{Fe}^{3+}$ and SCN -. You will then prepare a series of solutions with varying amounts of $\mathrm{Fe}^{3+}$ and $\mathrm{SCN}^{-}$initially present, determine the absorbance for $\mathrm{FeSCN}^{2+}$, and finally determine the value of $\mathrm{K}_{\mathrm{c}}$ at room temperature.

## PROCEDURE:

In Part A, the goal is to find the molar absorptivity constant, and in Part B, you will find the value of the equilibrium constant. Both parts use similar techniques, but make sure you use the correct reactant concentrations in each section. Check and double-check the concentrations before analyzing your solutions!

Before you leave lab, it is important that you share data with the other group members (essentially mL of KSCN and absorbance (or \%Transmittance) values). Also make sure to get all of the names of your lab partners for your final lab report.

## Part A: Determining the Molar Absorptivity Constant ( $\varepsilon$ )

Place approximately 30 mL of $\mathbf{0 . 1 0 0} \mathbf{M ~ F e}\left(\mathbf{N O}_{3}\right)_{3}$ in $1 \mathrm{M} \mathrm{HNO}_{3}$ in a dry labeled 100 mL beaker. The $\mathrm{HNO}_{3}$ allows the solute components to remain in solution, but it does not affect our calculations in this lab. Note also that there are two different stock solutions of $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ and KSCN at different concentrations. Make sure you choose the correct solution for part A or your experiment will not work! NEVER place solution back into the reagent bottle - once the solution is removed, the solution has to be placed in the waste bottle.

Place approximately 20 mL of $\mathbf{3 . 0 0} \times \mathbf{1 0}^{-4} \mathbf{M}$ KSCN into a second dry labeled 100 mL beaker. Clean and dry six $18 \times 150 \mathrm{~mm}$ test tubes and label 1-5 and B (blank).

Pipet 5.00 mL of the $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ solution into tubes 1-5 as demonstrated by the instructor. NEVER pipet directly from the bottle, only pipet from a beaker. Pipet $1,2,3,4$, or 5 mL of KSCN into the corresponding labeled test tube. Then add the correct number of mL of water to each test tube so that the total volume is 10.00 mL . The sixth test tube is the blank (or "dark tube') and will contain only water.

You will need to transfer a small quantity of each solution into a cuvette for analysis on your instrument (see below); ideally you will have six cuvettes, one for each of the test tubes from above. Make sure the cuvette is filled to at least $80 \%$ of the maximum volume to ensure that light flows through the sample.

You will be using either a Spectronic 21 or a SpectroVis Plus. Follow the appropriate instructions:

## Spectronic 21:

Determine the $\% \mathrm{~T}$ for each of the five solutions using a Spec 21 at 450 nm . Assume the path length, b , equals 1.00 cm for these trials. Convert the \%T readings into absorbance. Recall that $\mathrm{A}=\log (100 \% / \% \mathrm{~T})$.

## SpectroVis Plus:

- Connect the SpectroVis Plus to the LabQuest II. If everything is correct, you should see "USB: Abs" on the screen.
- Place the blank cuvette (with water only) in the SpectroVis, noting the arrow (and direction of light - do not place the "ribbed" walls of the cuvette face the arrow or source of light symbol.)
- Select "Sensors -> Calibrate -> USB: Spectrometer", then press OK if necessary. The following message is displayed: "Waiting 90 seconds for lamp to warm up..." After 90 seconds, the message will change to "Warmup complete" then select "Finish Calibration". When the message "Calibration completed" appears, select OK.
- Place one of the $\mathrm{FeSCN}^{2+}$ samples in the SpectroVis. Start data collection by pushing the green "start" button in the lower left corner of the LabQuest 2 . A full spectrum graph of the solution will be displayed. Stop data collection (by pressing the red button in the lower left corner) and move the cursor to the maximum wavelength at about 450 nm ; this is the wavelength of maximum absorbance ( $\lambda$ max). Record both the wavelength of maximum absorbance and the actual absorbance value in your lab notebook.
- Remove the cuvette and place a new cuvette (with another solution) inside. Repeat the above process until all solutions have recorded values of absorbance and the corresponding $\lambda$ max (and they should all be about 450 nm .)

You should see a linear relationship between mL of KSCN added and Absorbance; if not, you might want to redo the measurements. Dispose of the solutions in the waste bottle and clean your beakers and test tubes.

## Part B: Determining the Equilibrium Constant (K)

Place approximately 30 mL of $\mathbf{2 . 0 0} \times \mathbf{1 0}^{-\mathbf{3}} \mathbf{M} \mathbf{F e}\left(\mathbf{N O}_{\mathbf{3}}\right)_{3}$ in $1 \mathrm{M} \mathrm{HNO}_{3}$ in a dry labeled 100 mL beaker. Place approximately 20 mL of $\mathbf{2 . 0 0} \mathbf{x} \mathbf{1 0}^{-\mathbf{3}} \mathbf{~ M ~ K S C N}$ in a second dry labeled 100 mL beaker. Clean and dry five 18 x 150 mm test tubes and label 1-5.

Pipet 5.00 mL of the $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ solution into tubes 1-5. Pipet 1, 2, 3, 4, or 5 mL of KSCN into the corresponding test tube. Then add the correct number of mL of water to each test tube so that the total volume is 10.00 mL .

Determine the absorbance or \%T for each of the five solutions using the Spec 21 (at 450 nm ) or the SpectroVis Plus as before. Assume $b=1.00 \mathrm{~cm}$. Convert the $\%$ T readings into absorbance values if using the Spec 21 (the SpectroVis does this automatically for you.) You should see a linear relationship between the concentration of KSCN added and Absorbance; if not, you might want to re-do the measurements. Dispose of the solutions in the waste bottle when complete.

Calculations for Part A: Finding the value of $\varepsilon$
Determine the diluted molarity of $\mathrm{Fe}^{+3}$ and of SCN - present in each solution using the dilution equation $\left(\mathrm{M}_{1} \mathrm{x}\right.$ $V_{1}=M_{2} \times V_{2}$ ).

Example: Find the concentration of SCN- when 4.00 mL of a $3.00 * 10^{-4} \mathrm{M} \mathrm{KSCN}$ is diluted to a total of 10.00 mL .

Solution: The initial concentration of KSCN, $3.00 * 10^{-4} \mathrm{M}$, is being diluted to a new solution volume of 10.00 mL . We can use $\mathrm{M}_{1} \times \mathrm{V}_{1}=\mathrm{M}_{2} \times \mathrm{V}_{2}$ equation and solve for $\mathrm{M}_{2}$.
$\mathrm{M}_{2}=3.00 * 10^{-4} \mathrm{M} * 4.00 \mathrm{~mL} / 10.00 \mathrm{~mL}=\mathbf{1 . 2 0} * \mathbf{1 0}^{-4} \mathbf{M}$
Page Ib-2-4 / Determination of an Equilibrium Constant Lab (online) for Chemistry 223 Section W1

Find the concentration of $\mathrm{FeSCN}^{2+}$ using the law of limiting reactants.
Example: Find the concentration of $\mathrm{FeSCN}^{2+}$ when $\left[\mathrm{SCN}^{-}\right]=1.20 * 10^{-4} \mathrm{M}$ and $\left[\mathrm{Fe}^{3+}\right]=0.100 \mathrm{M}$.

Solution: Since $[\mathrm{SCN}-] \ll\left[\mathrm{Fe}^{3+}\right]$, it can be assumed that all of the $\mathrm{SCN}^{-1}$ has been converted to $\mathrm{FeSCN}^{2+}$ using Le Chatelier's Principle. Hence, the $\left[\mathrm{FeSCN}^{2+}\right]$ at equilibrium equals $\mathbf{1 . 2 0}$ * $\mathbf{1 0}^{-\mathbf{4}} \mathbf{M}$ in this example. Note: in part B you will use the value of $\varepsilon$ and the absorbance to calculate $\left[\mathrm{FeSCN}^{2+}\right]$.

Construct a graph of absorbance versus the concentration of $\mathrm{FeSCN}^{2+}$ on a computer or tablet (no hand drawn graphs.) Perform a linear regression on the data, and record your values of the slope, the y-intercept and the correlation coefficient (r). Determine the value of $\varepsilon$ from the slope (remember that the path length, b, equals 1.00 cm .) Print this graph and include it with your final lab report.

Calculations for Part B: Finding the value of $K$
To analyze this set of data, determine the initial molarity of $\mathrm{Fe}^{+3}$ and of $\mathrm{SCN}^{-}$present in each of your five solutions. See the section in Part A for assistance on this procedure.

Calculate the equilibrium concentration of $\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}}$ in each sample. This can be done using Beer's Law and the molar absorptivity constant determined in part $\mathrm{A} . \mathbf{c}_{\mathrm{FeSCN}}=\mathbf{A} / \mathbf{b} \varepsilon$

Example: Calculate the equilibrium concentration of $\mathrm{FeSCN}^{2+}$ when $\varepsilon=3420 \mathrm{~cm}^{-1} \mathrm{M}^{-1}, \% \mathrm{~T}=45.2 \%$, and $\mathrm{b}=1.00 \mathrm{~cm}$.

Solution: First convert \%T to absorbance. $\mathrm{A}=\log (100 \% / 45.2 \%)=0.345$
Now solve for the concentration, $\mathrm{c} . \mathrm{c}=\mathrm{A} / \mathrm{b} \varepsilon=0.345 / 1.00 \mathrm{~cm} * 3420 \mathrm{~cm}^{-1} \mathrm{M}^{-1}=\mathbf{1 . 0 0} * \mathbf{1 0}^{-4} \mathbf{M}$

Next, find the equilibrium concentrations of $\left[\mathrm{Fe}^{+3}\right]$ and $[\mathrm{SCN}-]$ using the following equations:

$$
\begin{aligned}
{\left[\mathrm{Fe}^{+3}\right]_{\mathrm{eq}}=} & {\left[\mathrm{Fe}^{+3}\right]_{\text {ini }}-\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} \text { and }[\mathbf{S C N}-]_{\mathrm{eq}}=\left[\mathrm{SCN}^{-}\right]_{\mathrm{ini}}-\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} } \\
& \text { where } \mathbf{e q}=\text { equilibrium concentration and ini }=\text { initial concentration }
\end{aligned}
$$

An ICE table may also be helpful (note that $\mathrm{x}=\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}}$ ):

|  | $\left[\mathrm{Fe}^{3+}\right]$ | $[\mathrm{SCN}]$ | $\left[\mathrm{FeSCN}{ }^{2+}\right]$ |
| ---: | :---: | :---: | :---: |
| initial | $\left[\mathrm{Fe}^{3+}\right]_{0}$ | $\left[\mathrm{SCN}^{-}\right]_{0}$ | 0 |
| change | -x | -x | +x |
| equilibrium | $\left[\mathrm{Fe}^{3+}\right]_{0}-\mathrm{x}$ | $\left[\mathrm{SCN}^{-}\right]_{0}-\mathrm{x}$ | x |
|  |  |  |  |

Finally, calculate the equilibrium constant, $\mathbf{K}_{\mathbf{c}}$, for each of the five solutions:

$$
\begin{aligned}
& \mathbf{K}_{\mathrm{c}}=\left[\mathrm{FeSCN}^{+2}\right]_{\mathrm{eq}} /\left\{\left[\mathrm{Fe}^{+3}\right]_{\mathrm{eq}} *\left[\mathrm{SCN}^{-}\right]_{\mathrm{eq}}\right\} \quad \text { or: } \\
& \text { (x) } \\
& \mathrm{K}_{\mathrm{c}}=\frac{(\mathrm{x})}{\left(\left[\mathrm{Fe}^{+3}\right]_{0}-\mathrm{x}\right)\left(\left[\mathrm{SCN}^{-}\right]_{0}-\mathrm{x}\right)}
\end{aligned}
$$

You should have five values of $\mathrm{K}_{\mathrm{c}}$ that are all relatively close to each other.

Determine the average $\mathrm{K}_{\mathrm{c}}$ value and deviation in parts per thousand (pt) for your calculations. See the pet handout on the CH 223 website or here: https://mhchem.org/ppt

## Determination of an Equilibrium Constant - Worksheet

## Your name:

Purpose: To determine the value of an equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ for the following reaction:

$$
\mathrm{Fe}^{+3}(\mathrm{aq})+\mathrm{SCN}_{(\mathrm{aq})} \rightleftharpoons \mathrm{FeSCN}^{+2}(\mathrm{aq}) \quad \mathrm{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

Goal \#1: Watch the following video related to this lab: http://mhchem.org/v/a.htm
Write down the following data from the video which relates to this lab:

| Part A: |  | Part B: |  |
| :---: | :---: | :---: | :---: |
| $\underline{\text { mL KSCN }}$ | \%Transmittance | mL KSCN | \%Transmittance |
| 1.00 |  | 1.00 |  |
| 2.00 |  | 2.00 |  |
| 3.00 |  | 3.00 |  |
| 4.00 |  | 4.00 |  |
| 5.00 |  | 5.00 |  |

Notes: (optional)

Goal \#2: Determine the value of $\varepsilon$ We will convert the $m L$ of KSCN into a concentration of KSCN. In Part A, the $[\mathrm{KSCN}] \ll\left[\mathrm{Fe}^{3+}\right]$, so we can assume that $[\mathrm{KSCN}]=\left[\mathrm{FeSCN}^{2+}\right]$. Next we will convert the $\%$ Transmittance values into Absorbance, then make a plot of Absorbance versus [FeSCN ${ }^{2+}$ ]. Finally, a linear regression of the Absorbance versus [FeSCN ${ }^{2+}$ ] data will lead us to the value of $\varepsilon$, the molar absorptivity coefficient, which will be used in the next section.
a. Convert $\mathbf{m L}$ of KSCN into the diluted concentration of [KSCN] (molarity) using $\mathbf{M}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}$ $=3.00 \times 10^{-4} \mathbf{M}$ for the initial molarity of KSCN and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. (see page I-2-4 for an example.)
b. Since $[\mathrm{KSCN}] \ll\left[\mathrm{Fe}^{3+}\right]$ in part A, so we can assume that $[\mathbf{K S C N}]=\left[\mathbf{F e S C N}^{2+}\right]$. Write the values for $\left[\mathrm{FeSCN}^{2+}\right]$ in the next column... these will be the x -axis values for your graph. (see page I-2-4 and 1-2-5 for an example.)

| $\operatorname{mLKSCN}\left(\mathrm{V}_{1}\right)$ | diluted $[\mathrm{KSCN}]\left(\mathrm{M}_{2}\right)$ |  |
| :--- | :--- | :--- |
| 1.00 | $-\left[\mathrm{FeSCN}^{2+}\right]$ |  |
| 2.00 | - | - |
| 3.00 | - | - |
| 4.00 | - |  |
| 5.00 | - |  |

Show an example of your work by converting 3.00 mL KSCN into a diluted [KSCN] and then into $\left[\mathrm{FeSCN}^{2+}\right]$ in the space below.

## Goal \#2 (continued)

c. Convert your \%Transmittance values from part $\boldsymbol{A}$ into absorbance using:

$$
\text { Absorbance }=\log (100 \% / \% \text { Transmittance })
$$

Absorbance values are unitless and will constitute the y-axis in the graph. See page I-2-5 for an example.

| mL KSCN | \%Transmittance | Absorbance |
| :--- | :--- | :--- |
| 1.00 | - |  |
| 2.00 | - |  |
| 3.00 | - |  |
| 4.00 | - |  |
| 5.00 | - |  |

d. Create a computer-generated graph in a program like Excel, Sheets, Numbers, etc. with Absorbance (Goal \#2, part c) versus [FeSCN ${ }^{2+}$ ] (Goal \#2, part b). Include the graph with this lab report. Graphs should be labeled correctly with appropriate axes, and the data should follow a straight line with a positive slope.
e. Perform a linear regression of the values used in Goal \#2, part d above (Absorbance versus [FeSCN ${ }^{2+}$ ]). You can do this in the graphing program you used in Goal \#2 part d above, or on your calculator, or using an online linear regression calculator (for example: http://www.alcula.com/calculators/statistics/linear-regression/) The slope of the line equals $\varepsilon$, the molar absorptivity coefficient, which we will use in Goal \#3 next.

Report the values for slope ( $\varepsilon$ ), y-intercept and the correlation coefficient (r) obtained from the linear regression below:
slope $=\varepsilon=$ $\qquad$
y -intercept $=$ $\qquad$
correlation coefficient $(\mathrm{r})=$ $\qquad$ (r is not the same as $R^{2}$ !)

Make sure you include a computer-generated graph with your lab report!

Goal \#3: Determine the value of $\mathbf{K}_{\mathbf{c}}$. We will convert the $m L$ of $K S C N$ and $F e^{3+}$ into diluted concentrations of $K S C N$ and $\mathrm{Fe}^{3+}$ in a method similar to that of Goal \#2. We will convert the Part B \%Transmittance values into absorbance, then we can use our $\varepsilon$, the molar absorptivity coefficient, to calculate the equilibrium concentrations of FeSCN ${ }^{2+}$ using the Beer-Lambert Law. Finally, using ICE tables, we will calculate the equilibrium concentrations of $\mathrm{Fe}^{3+}, \mathrm{SCN}^{-1}$ and $\mathrm{FeSCN}{ }^{2+}$ in order to calculate $K_{c}$, the equilibrium constant for this lab.
a. Convert mL of KSCN into the diluted concentration of [KSCN] (molarity) using $\mathbf{M}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}$ $=\mathbf{2 . 0 0} \times 10^{-\mathbf{3}} \mathbf{M}$ for the initial molarity of KSCN and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. (see page $I-2-4$ and Goal \#2 section a for examples.)
b. Convert $\mathbf{m L}$ of $\mathbf{F e}^{3+}$ into the diluted concentration of $\left[\mathrm{Fe}^{3+}\right]$ (molarity) using $\mathbf{M}_{1} \mathbf{V}_{\mathbf{1}}=\mathbf{M}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$. Use $\mathbf{M}_{\mathbf{1}}=$ $2.00 \times 10^{-3} \mathbf{M}$ for the initial molarity of $\mathrm{Fe}^{3+}$ and use a final volume $\mathrm{V}_{2}=10.00 \mathrm{~mL}$. These calculated $M_{2}$ values should all be the same since the initial volume ( $V_{l}$ ) are identical! (see page I-2-4 and Goal \#2 section a for examples.)

| $\underline{\mathrm{mLKSCN}}\left(\mathrm{V}_{1}\right)$ | diluted [KSCN] ( $\mathbf{M}_{2}$ ) | $\underline{\mathrm{mLFe}}{ }^{3+}\left(\mathrm{V}_{1}\right)$ | diluted $\left[\mathrm{Fe}^{3+}\right]\left(\mathrm{M}_{2}\right)$ |
| :---: | :---: | :---: | :---: |
| 1.00 |  | 5.00 |  |
| 2.00 |  | 5.00 |  |
| 3.00 |  | 5.00 |  |
| 4.00 |  | 5.00 |  |
| 5.00 |  | 5.00 |  |

Note:

- We will refer to "diluted $[\mathrm{KSCN}]$ " values as $\left[\mathbf{S C N}^{-1}\right]_{\mathbf{i}}$ in Goal \#3, part e, below
- We will refer to "diluted $\left[\mathrm{Fe}^{3+}\right]$ " values as $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{i}}$ in Goal \#3, part f, below

Show an example of your work by showing how to convert 3.00 mL KSCN into a diluted [KSCN]:

Show an example of your work by showing how to convert $5.00 \mathrm{~mL} \mathrm{Fe}{ }^{3+}$ into a diluted $\left[\mathrm{Fe}^{3+}\right]$ :

## Goal \#3 (continued)

c. Convert your \%Transmittance values from part B into absorbance using:

## Absorbance $=\log (\mathbf{1 0 0 \%} \% / \%$ Transmittance $)$

Reminder: these \%Transmittance values came from Goal \#1 Part B (the Lab Video). Absorbance values are unitless and will constitute the $y$-axis in the graph. (see page I-2-5 for an example of conversion.)

| mL KSCN | \%Transmittance (Part B) | Absorbance |
| :--- | :--- | :--- |
| 1.00 | - |  |
| 2.00 | - |  |
| 3.00 | - | - |
| 4.00 | - |  |
| 5.00 | - |  |

d. Using Beer-Lambert Law, we can convert your Absorbance (A) values (Goal \#3, part c) into concentration of [FeSCN ${ }^{2+}$ ] using:

$$
\text { Absorbance }=\mathbf{A}=\text { عbc }
$$

In this equation, $\mathbf{A}=$ Absorbance, $\varepsilon=$ the molar absorptivity coefficient (from Goal \#2, part e), $\mathbf{b}=$ path length (for this lab, $b=1.00 \mathrm{~cm}$ ) and $\mathbf{c}=$ concentration of $\left[\mathrm{FeSCN}^{2+}\right]$ (in $\mathrm{mol} / \mathrm{L}$, or just M). You want to solve for the equilibrium concentration of $\left[\mathrm{FeSCN}^{2+}\right]$, so $\mathbf{c}=\mathbf{A} / \varepsilon \mathbf{b}$
value of $\varepsilon=$ $\qquad$ (from Goal \#2, part e)

Page Ib-2-11 / Determination of an Equilibrium Constant Lab (online) for Chemistry 223 Section W1

## Goal \#3 (continued)

e. We can use the values of $\left[\mathbf{F e S C N}^{2+}\right]_{\text {eq }}$ from Goal \#3, part $d$ (above) to find the equilibrium values of $\left[\mathrm{SCN}^{-1}\right]$ or $\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$. To find the equilibrium values of $\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$ do the following:

$$
\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}=\left[\mathrm{SCN}^{-1}\right]_{\mathrm{i}}-\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}
$$

- $\left[\mathbf{S C N}^{-1}\right]_{i}$ values can be found in Goal \#3, part b above
- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above

| mL KSCN | $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ | $\left[\mathrm{SCN}^{-1}\right]_{\text {eq }}$ |
| :---: | :---: | :---: |
| 1.00 |  |  |
| 2.00 |  |  |
| 3.00 |  |  |
| 4.00 |  |  |
| 5.00 |  | , |

f. In a similar fashion, we can use the values of $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}$ from Goal \#3, part d to find the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]$ or $\left[\mathrm{Fe}^{3+}\right]_{\text {eq }}$. To find the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}}$ do the following:

$$
\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}}=\left[\mathrm{Fe}^{3+}\right]_{\mathrm{i}}-\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}
$$

- $\left[\mathrm{Fe}^{3+}\right]_{i}$ values can be found in Goal \#3, part b above - they should be all identical!
- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above

| $\mathbf{m L F e}^{3+}$ | $\left[\mathrm{Fe}^{3+}\right]_{i}$ | $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}$ |  |
| :--- | :--- | :--- | :--- |
| 5.00 | - |  |  |
| 5.00 | - |  |  |
| 5.00 | - | - |  |
| 5.00 | - | - |  |
| 5.00 | - | - |  |

## Goal \#3 (continued)

g. We can use the equilibrium values of $\left[\mathrm{Fe}^{3+}\right]_{\mathrm{eq}},\left[\mathrm{SCN}^{-1}\right]_{\mathrm{eq}}$ and $\left[\mathrm{FeSCN}^{2+}\right]_{\mathrm{eq}}$ to calculate the value of $\mathbf{K}_{\mathbf{c}}$.

$$
\mathbf{K}_{c}=\frac{\left[\mathrm{FeSCN}^{+2}\right]}{\left[\mathrm{Fe}^{+3}\right]\left[\mathrm{SCN}^{-1}\right]}
$$

- $\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }}$ values can be found in Goal \#3, part d above
- $\left[\mathbf{S C N}^{-1}\right]_{\text {eq }}$ values can be found in Goal \#3, part e above
- $\left[\mathrm{Fe}^{3+}\right]_{\text {eq }}$ values can be found in Goal \#3, part $f$ above
$\left[\mathrm{FeSCN}^{2+}\right]_{\text {eq }} \quad\left[\mathbf{S C N}^{-1}\right]_{\text {eq }} \quad\left[\mathrm{Fe}^{3+}\right]_{\text {eq }} \quad \mathbf{K}_{\boldsymbol{c}}$

## Average of five $K_{c}$ values =

$\qquad$

Parts per thousand $=$ $\qquad$

## Info on parts per thousand: https://mhchem.org/ppt

In the space below, show how you calculated the first $\mathrm{K}_{\mathrm{c}}$ value, the average of the five $\mathrm{K}_{\mathrm{c}}$ values, and the parts per thousand.

## Postlab Questions:

A student mixes 5.00 mL of $2.00 \times 10^{-3} \mathrm{M} \mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$ with $5.00 \mathrm{~mL} 2.00 \times 10^{-3} \mathrm{M} \mathrm{KSCN}$. She finds that in the equilibrium mixture the concentration of $\mathrm{FeSCN}^{+2}$ is $1.40 \times 10^{-4} \mathrm{M} . \quad \mathbf{F e}^{+3}{ }_{(\mathrm{aq})}+\mathbf{S C N}_{(\mathrm{aq})} \rightleftharpoons \mathrm{FeSCN}^{+2}(\mathrm{aq})$
a. What is the initial concentration in solution of the $\mathrm{Fe}^{+3}$ and $\mathrm{SCN}-$ ?
b. Create an ICE table for this problem. What is the equilibrium constant value for this reaction?

# CH 223 Spring 2024: 'Le Chatelier's Principle <br> (online)" Lab - Instructions 

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section H1 of CH 223, please use this link: http://mhchem.org/q/3a.htm

Step One:
There are four videos for the "Le Chatelier" lab, one per Goal. The links will be listed at the beginning of the appropriate Goal, and you should watch each of them (and record the data if appropriate.)

Step Two:
Complete pages Ib-3-7 through Ib-3-11 using the "Le Chatelier" video and the actual lab instructions on pages $\mathrm{Ib}-3-2$ through $\mathrm{Ib}-3-5$. Include your name on page $\mathrm{Ib}-3-7$ !

Step Three:
Submit your lab (pages Ib-3-7 through Ib-3-11 only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, April 17 by 11:59 PM. I recommend a free program (ex: CamScanner, https:// camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Le Chatelier's Principle

Chemical systems tend to exist in a state of equilibrium. If this equilibrium is disturbed, the reaction may shift in the forward or reverse direction. If the principles governing the equilibrium system are understood, then predictions can be made as to how to drive the reaction in the forward or reverse directions.

In the following equilibrium system, in which $\mathrm{A}, \mathrm{B}$, and C are molecules or ions in solution, their relative concentrations at a given temperature must equal a constant, $\mathbf{K}$ :

$$
\mathbf{a} \mathbf{A}(\mathbf{a q}) \rightleftharpoons \overline{\mathrm{b}} \overline{\mathbf{B}}(\mathbf{a q})+\mathbf{c} \widetilde{\mathbf{C}}(\mathbf{a q}) \quad \quad \text { equilibrium constant }=\mathrm{K}=\frac{[\mathrm{B}]^{b}[\mathrm{C}]^{c}}{[\mathrm{~A}]^{a}}
$$

For K to remain constant, if any concentrations are altered, the other components must also shift in concentration. For example, if the concentration of A is increased, the concentrations of B and C will also increase to keep $K$ at a constant value. The reaction shifts in the forward direction. If the concentration of $B$ or C is increased, the reaction will shift in the reverse direction thereby increasing the concentration of A and lowering the concentrations of both B and C . Furthermore, if the concentration of A is reduced, the reaction will shift in the reverse direction, lowering the concentrations of B and C and subsequently increasing the concentration of A to balance the equilibrium. If you attempt to change a system in chemical equilibrium, it will react in such a way to counterbalance the change you attempted.

In addition to changes in concentration, a change in the temperature of the system will affect the equilibrium. If the reaction is exothermic in the forward direction, such that heat is a product, an increase in temperature will shift the reaction in the reverse direction. Therefore, an increase in temperature favors the endothermic reaction.

In solution, there are often more than one equilibria maintained. The most important equilibrium involves the dissociation of water:

$$
\mathbf{H}_{2} \mathbf{O}(\mathbf{l}) \rightleftharpoons \mathbf{H}^{+}(\mathbf{a q})+\mathbf{O H}(\mathbf{a q})
$$

This equation must always be in equilibrium in aqueous solution. If $\mathrm{H}^{+}$ion or $\mathrm{OH}^{-}$ion are present in another equilibrium solution, the equilibrium can be affected by adding acid or base to the system (parts A and D in the procedure). However, if neither $\mathrm{H}^{+}$ion nor $\mathrm{OH}^{-}$ion is present in the equilibrium equation, the equilibrium will not be influenced by the addition of acids or bases (parts B and C).

## PROCEDURE:

In this experiment you will work with several equilibrium systems, varying conditions such as temperature and concentrations thereby forcing shifts in the forward or reverse directions. You will be asked to interpret your observations in terms of the principles presented above.

The waste from parts B and C should be poured in a waste bottle. Parts A and D may be poured down the drain.

## PROCEDURE: Part A: Solubility Equilibrium: Finding a value for $K_{\text {sp }}$

Many ionic compounds have limited water solubility, dissolving only partially in water. An example is $\mathrm{PbCl}_{2}$ :

$$
\mathbf{P b C l}_{2}(\mathbf{s}) \rightleftharpoons \mathbf{P b}^{+2}(\mathbf{a q})+2 \mathbf{C l}-(\mathbf{a q}) \quad \mathbf{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{+2}\right]\left[\mathrm{Cl}^{-}\right]^{2}
$$

The concentration of $\mathrm{PbCl}_{2}$ does not enter into the equilibrium equation because it is a solid and therefore has a constant effect on the system, independent of its amount. The equilibrium constant for a solubility equilibrium is called the solubility product constant and symbolized as $\mathbf{K}_{\text {sp }}$. For this equilibrium to exist, there must be some solid $\mathrm{PbCl}_{2}$ present in the system. If there is no solid present, there is no equilibrium.

1. Set up a hot water bath using a 400 mL beaker for step 2 below. To a (room temperature) test tube, add 5.0 $\mathrm{mL} 0.30 \mathrm{M} \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$. Add 0.30 M HCl in 0.5 mL increments $\left(10\right.$ drops) to the $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ until a white precipitate forms.
a. Record the volume of HCl needed and determine the moles of Cl - present in your solution.
b. Determine the moles of $\mathrm{Pb}^{+2}$ ion present in the final solution.
c. Calculate $\mathrm{K}_{\text {sp. }}$. (Note: You must use diluted concentrations of ions in $\mathrm{mol} / \mathrm{L}$ )
d. Why did the $\mathrm{PbCl}_{2}$ not precipitate immediately on addition of HCl ?
2. Observing the effect of temperature on the system can determine the sign of enthalpy for this reaction.
a. Place the test tube in hot water and record your observations.
b. Place the test tube in cold water and record your observations.
c. What is the sign of $\Delta \mathrm{H}$ for the above reaction? Explain.
d. What happened to the value of $\mathrm{K}_{\mathrm{sp}}$ in the hot solution? (Increase, decrease, no change) Explain.
3. Add deionized water to the test tube in 0.5 mL increments, stirring well after each addition.
a. Record the volume of water added when the precipitate just dissolves.
b. Calculate the molar concentration of $\mathrm{Pb}^{+2}$ and $\mathrm{Cl}^{-1}$ ions and your reactant quotient $(\mathrm{Q})$.
c. Explain why the $\mathrm{PbCl}_{2}$ dissolved in water.

## Part B: Complex Ion Equilibria

Many metallic ions exist as complex ions in solution, combining with other ions or molecules called ligands. While complex ions are stable, they may be converted to other complex ions by the addition of ligands that form more stable complexes. Common ligands include $\mathrm{OH}^{-}, \mathrm{NH}_{3}$, and $\mathrm{Cl}^{-}$, etc. In this section the cobalt (II) ion can exist as either the pink complex ion $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}+2(\mathrm{aq})$ or the blue complex ion $\mathrm{CoCl}_{4}^{-2}(\mathrm{aq})$ depending on the conditions. The principles of equilibrium can be used to predict which ion will be present.

$$
\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6^{+2}}(\mathrm{aq}, \mathrm{pink})+4 \mathrm{Cl}(\mathrm{aq}) \rightleftharpoons \mathrm{CoCl}_{4}^{-2}(\mathrm{aq}, \text { blue })+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

1. Place a few crystals of $\mathrm{CoCl}_{2}-6 \mathrm{H}_{2} \mathrm{O}$ in a regular test tube. Record the color and determine the Co (II) complex ion present in solution for each of the following. Explain.
a. Add $2 \mathrm{~mL}(40$ drops $)$ of 12 M HCl (CAUTION) and stir to dissolve the crystals.
b. Add 2 mL increments of deionized $\mathrm{H}_{2} \mathrm{O}$ to the test tube until no further color change occurs.
c. Place the sample in hot water and cold water and record the color change. What is the sign of $\Delta \mathrm{H}$ for the above equation? Explain.

## Part C: Acid-Base Indicators

Acid-base indicators are chemical substances which change color in solution when $\left[\mathrm{H}^{+}\right]$changes. Methyl violet (HMV) is an example of an acid-base indicator. In solution, HMV dissociates as follows:

$$
\mathbf{H M V}(\mathrm{aq}, \text { yellow }) \rightleftharpoons \mathbf{H}^{+}(\mathrm{aq})+\mathbf{M V}-(\mathrm{aq}, \text { violet })
$$

In solution, HMV has an intense yellow color while MV- is violet. Therefore, a change in $\left[\mathrm{H}^{+}\right]$will affect the color of the indicator solution.

1. Add 5 mL of deionized $\mathrm{H}_{2} \mathrm{O}$ to a test tube. Add a few drops of methyl violet indicator. Record the color.
2. What reagent could be added to shift the equilibrium (change color)? Design and test your hypothesis to demonstrate this equilibrium shift. Explain your results.
3. What reagent could be added to shift the equilibrium back to its original color? Design and test this hypothesis. Explain your results.

## Part D: Dissolving Insoluble Solids

Not all solids will dissolve by adding more water or heating the solution. However, in these cases we can employ the principles of equilibrium to dissolve solids. We will use $\mathrm{Zn}(\mathrm{OH})_{2}$ as an example:

$$
\mathbf{Z n}(\mathbf{O H})_{2}(\mathbf{s}) \rightleftharpoons \mathbf{Z n}^{+2}(\mathbf{a q})+\mathbf{2} \mathbf{O H}-(\mathbf{a q}) \text { where } \mathbf{K}_{\text {sp }}=\left[\mathbf{Z n}^{+2}\right]\left[\mathrm{OH}^{-}\right]^{2}=\mathbf{5} \times 10^{-17}
$$

The equilibrium constant for this dissociation is quite small, indicating that the reaction does not go very far to the right. Thus, $\mathrm{Zn}(\mathrm{OH})_{2}$ is virtually insoluble in water. In a saturated solution, $\left[\mathrm{Zn}^{+2}\right] \mathrm{x}\left[\mathrm{OH}^{-}\right]^{2}$ must equal 5 x $10^{-17}$. However, if this product is somehow lowered to less than $5 \times 10^{-17}$, then $\mathrm{Zn}(\mathrm{OH})_{2}$ will dissolve until the products equal $\mathrm{K}_{\mathrm{sp}}$, where equilibrium will again be obtained. To do this, the concentration of one of the products must be lowered rather drastically. Using a second equilibrium present in solution:

$$
\mathbf{H}^{+}(\mathbf{a q})+\mathbf{O H}(\mathbf{a q}) \rightleftharpoons \mathbf{H}_{2} \mathbf{O}(\mathbf{l})
$$

the addition of an acid to the solution will increase $\left[\mathrm{H}^{+}\right]$and thereby lower [ $\left.\mathrm{OH}^{-}\right]$. This in turn will drive the above reaction to the right, dissolving $\mathrm{Zn}(\mathrm{OH})_{2}$.

Alternatively, we can lower the concentration of $\mathrm{Zn}^{+2}$ ion by taking advantage of the fact that zinc ion forms stable complex ions with $\mathrm{OH}^{-}$and $\mathrm{NH}_{3}$ :

$$
\begin{array}{ll}
\mathbf{Z n}^{+2}(\mathrm{aq})+4 \mathbf{O H}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Zn}(\mathrm{OH})_{4^{-2}}(\mathrm{aq}) & \mathrm{K}_{1}=\mathbf{3} \times 10^{15} \\
\mathbf{Z n}^{+2}(\mathrm{aq})+4 \mathrm{NH}_{3}(\mathrm{aq}) \rightleftharpoons \mathbf{Z n}\left(\mathrm{NH}_{3}\right) 4^{+2}(\mathrm{aq}) & \mathrm{K}_{2}=\mathbf{1} \times 10^{9}
\end{array}
$$

In high concentrations of $\mathrm{OH}^{-}$or $\mathrm{NH}_{3}$, the above reactions are driven to the right, lowering $\left[\mathrm{Zn}^{+2}\right]$.

1. To each of three small test tubes, add about $2 \mathrm{~mL} 0.1 \mathrm{M} \mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$. Add one drop 6 M NaOH to each test tube and stir. Record your observations.
a. To the first test tube add 6 M HCl drop by drop. Record and explain your observations.
b. To the second test tube add 6 M NaOH drop by drop. Stir well and explain your observations.
c. To the third test tube add $6 \mathrm{M} \mathrm{NH}_{3}$ (or $\mathrm{NH}_{4} \mathrm{OH}$ ) drop by drop. Stir well and explain your observations.
2. Repeat the above procedure using 2 mL of $0.1 \mathrm{M} \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ instead of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ in three separate test tubes. Add one drop of 6 M NaOH to each test tube and stir. Record your observations.
a. Use the same volume of HCl as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
b. Use the same volume of 6 M NaOH as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
c. Use the same volume of $6 \mathrm{M} \mathrm{NH}_{3}\left(\right.$ or $\left.\mathrm{NH}_{4} \mathrm{OH}\right)$ as you used with the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$, above, and stir well. Record your observations.
3. Explain the following in your report:
a. What insoluble hydroxide formed when one drop of NaOH was added to the $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}$ ? To the $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ ?
b. Explain why some of the reactions were similar between the two metal ions and why some were different.
c. Why does an insoluble hydroxide tend to dissolve in acidic solution?
d. Does $\mathrm{Mg}^{+2}$ ion appear to form complex ions with $\mathrm{OH}^{-}$and $\mathrm{NH}_{3}$ ? Explain.

## Le Chatelier's Principle

## Your name:

Purpose: To explore Le Chatelier's Principle through four different chemical scenarios.
This lab will be split into four Goals. The goals will require watching a video and answering questions based on the video... there are also some postlab questions at the end. Each goal correlates with one Part (A-D) in the actual face-to-face lab, so looking through the previous sections might prove helpful.

## Goal \#1: Part A: Solubility Equilibrium: Finding a value for $K_{\text {sp }}$

First, watch the following video related to Part A of this lab: http://mhchem.org/v/e.htm

In Part A, the solutions used were $\left.\mathbf{0 . 3 0} \mathbf{M ~ P b ( N O} \mathbf{N}_{2}\right)_{2}$ and $\mathbf{0 . 3 0} \mathbf{M ~ H C l}$. Show all work necessary for these problems.

How many mL of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ were used in the video? $\qquad$ mL

How many mL of HCl were used in the video? $\qquad$ mL

Total volume of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and $\mathrm{HCl}=$ $\qquad$ mL (add up two previous volumes)

Calculate the moles of $\mathrm{Pb}^{2+}$ added to the solution: $\qquad$ moles

Calculate the moles of $\mathrm{Cl}^{-1}$ added to the solution: $\qquad$ moles

Calculate the concentration $(\mathrm{M})$ of $\mathrm{Pb}^{2+}$ at equilibrium: $\qquad$ M (use total volume!)

Calculate the concentration (M) of $\mathrm{Cl}^{-1}$ at equilibrium: $\qquad$ M (use total volume!)

Calculate the value of $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Cl}^{-1}\right]^{2} \mathrm{~K}_{\mathrm{sp}}=$ $\qquad$
Remember: $\left[\mathrm{Pb}^{2+}\right]=\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{M})$ and $\left[\mathrm{Cl}^{-1}\right]=\mathrm{HCl}(\mathrm{M})$. Show work!

## Goal \#1: Part A continued

In the video, what happened to the solid $\mathrm{PbCl}_{2}$ as it was heated up?

In the video, what happened to the $\mathrm{PbCl}_{2}$ solution as it was cooled down?

Remembering that $\mathrm{K}_{\text {sp }}$ is defined here as: $\mathbf{P b C l}_{2}(\mathbf{s}) \rightleftharpoons \mathbf{P b}^{\mathbf{2}}(\mathbf{a q})+\mathbf{2} \mathbf{C l}^{-1}(\mathbf{a q})$, is this reaction endothermic or exothermic? Explain.

In the video, how much water was added to the solution to make the $\mathrm{PbCl}_{2}(\mathrm{~s})$ disappear? $\qquad$ mL

Calculate the value of $\mathrm{Q}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Cl}^{-1}\right]^{2} \mathrm{Q}=$ $\qquad$ Show work!

Hint: use moles of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and HCl from the previous page, divide each by the total volume (which includes the water added in the previous question) to find $\left[\mathrm{Pb}^{2+}\right]$ and $\left[\mathrm{Cl}^{-1}\right]$, then calculate $Q$.

## Goal \#2: Part B: Complex Ion Equilibria

First, watch the following video related to Part B of this lab: http://mhchem.org/v/b.htm

When HCl was added to the crystals, what color was observed? (circle one) Pink Blue

When water was added to the solution, what color was observed? (circle one) Pink Blue
Explain what happened in the video when the sample was added to hot water and cold water:

Is this reaction endothermic (positive $\Delta H$ ) or exothermic (negative $\Delta H$ )? Explain.

Goal \#3: Part C: Acid-Base Indicators

## First, watch the following video related to Part C of this lab: http://mhchem.org/v/c.htm

When drops of methyl violet were added to water, what color was observed? Yellow Violet (circle one)

What chemical (reagent) was used to change the color of the solution in the video? Explain why the solution changed color.

What chemical (reagent) was used to change the color of the solution back to the original color in the video? Explain why adding this reagent worked.

## Goal \#4: Part D: Dissolving Insoluble Solids

First, watch the following video related to Part D of this lab: http://mhchem.org/v/d.htm
a. The Zinc test

When one drop of NaOH was added to each of the three Zn -containing test tubes in the video, what was observed? Explain why this happened and identity the white solid.

Explain what happened in the video when HCl was added to the first white solid-containing test tube. Do acids appear to dissolve insoluble hydroxides?

Explain what happened in the video when excess NaOH was added to the second white solid-containing test tube. Do you think that the complex ion $\left(\mathbf{Z n}(\mathbf{O H})_{4}{ }^{-2}(\mathbf{a q})\right)$ could have formed? Explain.

Explain what happened in the video when $\mathrm{NH}_{3}$ was added to the third white solid-containing test tube. Do you think that the complex ion $\left(\mathbf{Z n}\left(\mathbf{N H}_{3}\right)_{4}{ }^{+2}(\mathbf{a q})\right)$ could have formed? Explain.

## Goal \#4: Part D: continued

b. The Magnesium test

When one drop of NaOH was added to each of the three Mg -containing test tubes in the video, what was observed? Explain why this happened and identity the white solid.

Explain what happened in the video when HCl was added to the first white solid-containing test tube. Do acids appear to dissolve insoluble hydroxides?

Explain what happened in the video when excess NaOH was added to the second white solid-containing test tube. Do you think that a complex ion could have formed? Explain.

Explain what happened in the video when $\mathrm{NH}_{3}$ was added to the third white solid-containing test tube. Do you think that a complex ion could have formed? Explain.

In terms of electron orbitals, what differences can be found between zinc and magnesium?

Do complex ions appear to form easier with main group metals or transition metals? Why?

## Postlab Questions:

1. Methyl orange (HMO) is a common acid-base indicator. In solution it ionizes according to the equation:
$\mathbf{H M O}(\mathrm{aq}, \mathrm{red}) \rightleftharpoons \mathrm{H}^{+}(\mathrm{aq})+\mathrm{MO}^{-}(\mathrm{aq}$, yellow $)$
Chat adds 5 mL of deionized water to a test tube and adds 5 drops of methyl orange. He is captivated by the lovely yellow color of the solution.
a. If Chat adds 6 M HCl to his solution, what color will he observe? Explain.
b. If Chat next adds 6 M NaOH to the solution, what color will be observed? Explain.
2. Zinc hydroxide is relatively insoluble in water. The reaction is represented as:
$\mathbf{Z n}(\mathbf{O H})_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Zn}^{+2}(\mathrm{aq})+2 \mathbf{O H}^{-}(\mathrm{aq})$
a. What is the equilibrium expression for the above reaction?
b. For $\mathrm{Zn}(\mathrm{OH})_{2}$ to be soluble in solution, $\left[\mathrm{Zn}^{+2}\right]$ or $\left[\mathrm{OH}^{-}\right]$must be relatively small. Explain.
c. Would you expect $\mathrm{Zn}(\mathrm{OH})_{2}$ to dissolve if acid were added to the solution? Explain.

## CH 223 Spring 2024: "Titration Calculations (online)" Lab-Instructions

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section $\mathrm{H1}$ of CH 223 , please use this link: http://mhchem.org/q/4a.htm

Step One:
Watch the lab video for the "Titration Calculations" lab, found here:

> http://mhchem.org/v/g.htm

There is no data to record in this video.
Step Two:
Complete the four problems in this lab using page Ib-4-25. You will need to create and submit four computer generated graphs with this report, plus you need to submit additional page(s) showing detailed calculations of your work for this lab. Include your name on page Ib-4-25!

Step Three:
Submit your lab (page Ib-4-25 plus the graphs and work pages only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, April 24 by 11:59 PM. I recommend a free program (ex: CamScanner, https://camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Acid and Base Titrations - Equation Guide

Strong Acid + Strong Base: $(S A+S B)$

Initial Region:

$$
\mathbf{p H}=-\log \left(\mathbf{n}_{\mathrm{sa}} / V_{\mathrm{sa}}\right)
$$

Pre-Equivalence Region: $\quad \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$
or $\mathbf{p H}=-\log \left(\mathbf{C}_{\mathbf{s a}}\right)$
or $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{\text {total }}}\right)$
Equivalence:

$$
\mathbf{p H}=7
$$

Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$ or $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{\text {total }}}\right)$

Strong Base + Strong Acid: $(S B+S A)$

Initial Region:

$$
\mathrm{pH}=14+\log \left(\mathbf{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right)
$$

or $\mathbf{p H}=14+\log \left(\mathbf{C}_{\mathbf{s b}}\right)$
Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
or $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{\text {total }}}\right)$
Equivalence:
$\mathbf{p H}=7$
Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

$$
\text { or } \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{\text {total }}}\right)
$$

Weak Acid + Strong Base: $(W A+S B)$
Initial Region:

$$
\mathbf{p H}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}} \quad \text { or } \mathbf{p H}=-\log \sqrt{K_{a} \cdot C_{w a}}
$$

Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)$
Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K}_{\mathbf{a}}$

Equivalence:

$$
\mathbf{p H}=14+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}
$$

$$
\text { or } \mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot C_{w b}}
$$

Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{w a}}{V_{s b}+V_{w a}}\right)$

$$
\text { or } \mathbf{p H}=14+\log \left(\frac{n_{s b}-n_{w a}}{V_{\text {total }}}\right)
$$

Continued on next page

Initial Region:

$$
\mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}} \quad \text { or } \mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot C_{w b}}
$$

Pre-Equivalence Region: $\quad \mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)$
Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K}_{\mathbf{a}}$
Equivalence:

$$
\begin{array}{ll}
\text { Equivalence: } \quad \mathbf{p H}=-\log \sqrt{\frac{K_{w}}{K_{b}} \cdot \frac{n_{w b}}{\left(V_{w b}+V_{s a}\right)}} & \text { or } \mathbf{p H}=-\log \sqrt{K_{a} \cdot C_{w a}} \\
\text { Post-Equivalence Region: } \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right) & \text { or } \mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{t o t a l}}\right)
\end{array}
$$

## Guide to Symbols

```
\(\mathbf{n}=\) moles
\(\mathbf{V}=\) volume (L)
\(\mathbf{C}=\) concentration ( M or \(\mathrm{mol} / \mathrm{L}\) )
\(\mathbf{s a}=\) strong acid
\(\mathbf{s b}=\) strong base
\(\mathbf{w a}=\) weak acid
\(\mathbf{w b}=\) weak base
\(\mathbf{K}_{\mathbf{a}}=\) acid dissociation constant for a weak acid
\(\mathbf{p K}_{\mathrm{a}}=-\log K_{\mathrm{a}}\)
\(K_{a}=10-\mathrm{pKa}\)
\(\mathbf{K}_{\mathbf{b}}=\) base dissociation constant for a weak base
\(\mathbf{p K}_{\mathbf{b}}=-\log \mathbf{K}_{\mathbf{b}}\)
\(K_{b}=10-\mathrm{pKb}\)
\(\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}=\) autoionization constant for water at \(25^{\circ} \mathrm{C}\)
Also, \(\mathbf{K}_{\mathbf{w}}=\left[\mathbf{H}_{\mathbf{3}} \mathbf{O}^{+}\right]^{*}[\mathbf{O H}]=\mathbf{K}_{\mathbf{a}} * \mathbf{K}_{\mathbf{b}}=\mathbf{1 0}^{-14}\)
\(\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\)
\(\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]\)
\(14=\mathbf{p H}+\mathbf{p O H}=\mathbf{p K}_{\mathbf{a}}+\mathrm{pK}_{\mathbf{b}}\)
```

## Strong Acid + Strong Base Titration - Overview

Initial:
$\mathrm{pH}=-\log \left[\mathrm{n}_{\mathrm{sa}} / \mathrm{V}_{\mathrm{sa}}\right]$
Pre-equivalence: $\quad \mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right)$
Equivalence:
$\mathrm{pH}=7$ (neutral salt + water)
Post-equivalence: $\mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{sa}}}\right)$

## Strong Base + Strong Acid Titration - Overview

Initial:
Pre-equivalence:
Equivalence:
Post-equivalence: $\mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right)$

## Weak Acid + Strong Base Titration - Overview

Initial:

$$
\mathrm{pH}=-\log \sqrt{\mathrm{K}_{\mathrm{a}} \mathrm{C}_{\mathrm{wa}}}
$$

Pre-equivalence:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}\right)
$$

Equivalence:

$$
\mathrm{pH}=14+\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{a}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{wa}}+\mathrm{V}_{\mathrm{sb}}}\right)}
$$

$$
\text { Post-equivalence: } \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{wa}}}\right)
$$

## Weak Base + Strong Acid Titration - Overview

Initial:
Pre-equivalence:

$$
\begin{aligned}
& \mathrm{pH}=14+\log \sqrt{\mathrm{K}_{\mathrm{b}} \mathrm{C}_{\mathrm{wb}}} \\
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{n}_{\mathrm{sa}}}\right)
\end{aligned}
$$

Equivalence:

$$
\mathrm{pH}=-\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{b}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wb}}}{\mathrm{~V}_{\mathrm{wb}}+\mathrm{V}_{\mathrm{sa}}}\right)}
$$

Post-equivalence:
$\mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{wb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{wb}}}\right)$

## CH 223 Guide to Acid and Base Titration Calculations

Acid and base titrations can be a challenging concept for students to conquer in CH 223 . This handout will help prepare you for the types of problems associated with titrations.

A titration is an experimental procedure whereby a solution (usually either acidic or basic) is added dropwise to a second solution (usually either acidic or basic.) One solution will be acidic while the other will be basic. The solution that is added dropwise is called the titrant. Titrations are often graphed using $\mathbf{p H}$ as the y -axis and Volume of Titrant ( mL ) as the x -axis. Sometimes a second y -axis is used to plot the first derivative; we shall explore this concept in the labs during CH 223.
pH is defined as the negative $\log$ of the hydronium concentration, i.e. $\mathbf{p H}=-\boldsymbol{\operatorname { l o g }}\left[\mathbf{H}_{3} \mathbf{O}^{+}\right]$. All of the calculations given below reflect this basic idea. Values of pH less than seven indicate acidic conditions, while pH values greater than seven indicate basic conditions; a pH reading of 7 is neutral (neither acidic nor basic). Weak acids, weak bases, strong acids and strong bases require different formulas to find the concentration of $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$; hence, there are different mathematical approaches to titrations depending on the substituents being titrated. We shall concern ourselves only with monoprotic acids and bases - those that have only one equivalent of $\mathrm{H}_{3} \mathrm{O}^{+}$or OH - to offer.

We will study four monoprotic titration combinations:

- Strong acid titrated with strong base: the pH is initially acidic but becomes more basic as the strong base titrant is added
- Strong base titrated with strong acid: the pH is initially basic but becomes more acidic as the strong acid titrant is added
- Weak acid titrated with strong base: the pH is initially somewhat acidic but becomes more basic as the strong base titrant is added
- Weak base titrated with strong acid: the pH is initially somewhat basic but becomes more acidic as the strong acid titrant is added

Weak acid + weak base titration combinations require an intensive analysis of $\mathrm{K}_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ constants and are of limited versatility; hence, we will cover only the first four types of titrations.

Before you begin calculations for any titration in CH 223, do the following:

1) Determine if solution to be titrated contains an acid or a base, and determine if it is strong or weak.
2) Determine if the titrant is an acid or base and if it is weak or strong
3) If the solution contains a weak acid, find the $\mathbf{K}_{\mathbf{a}}$; if a weak base, find $\mathbf{K}_{\mathbf{b}}$.
4) Refer to the appropriate section:

- Strong Acid (solution) titrated with a Strong Base: Section One
- Strong Base (solution) titrated with a Strong Acid: Section Two
- Weak Acid (solution) titrated with a Strong Base: Section Three
- Weak Base (solution) titrated with a Strong Acid: Section Four

Notes: Weak acids with weak bases and weak bases with weak acids will not be covered in CH 223.
Polyprotic acid and base titrations will not be mathematically covered in CH 223 Redox titrations will be covered in the subsequent electrochemistry chapter. Additional information on pH calculations can be found in the Web-only handout "A Closer Look at Titrations" available on the CH 223 website

## Section One: Strong Acid + Strong Base (SA + SB) Titration <br> Equivalence Point $\mathbf{p H}=\mathbf{7}$ neutral

## Before you begin:

Strong acids titrated with strong bases will neutralize each other at the equivalence point. Therefore, you should expect to see a neutral pH when the quantity of acid equals the quantity of base added.

## Determine the following quantities:

$\mathbf{V}_{\mathrm{sa}}=$ volume of strong acid initially present
$\mathbf{n}_{\mathrm{sa}}=$ moles of strong acid $\left(=\mathrm{C}_{\mathrm{sa}} * \mathrm{~V}_{\mathrm{sa}}\right)$
$\mathbf{C}_{\text {sb }}=$ concentration of strong base
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base to reach equivalence point ( $=\mathrm{n}_{\mathrm{sa}} / \mathrm{C}_{\mathrm{sb}}$ )

## Analysis Section:

There are four regions in $\mathrm{SA}+\mathrm{SB}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=-\log \left(\mathbf{n}_{\mathrm{sa}} / \mathbf{V}_{\mathrm{sa}}\right)$

The pH will reflect the strong acid only - no strong base has been added.

- Pre-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the remaining acid in solution after some neutralization with strong base. $\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{sb}}$ in this region.

- Equivalence: $\mathbf{p H}=\mathbf{7}$
$\mathrm{n}_{\mathrm{sa}}=\mathrm{n}_{\mathrm{s} \text { b }}$, so water and a neutral salt will be produced at this point.
- Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the excess base remaining after neutralizing the strong acid.
$\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{sa}}$ in this region.
Example: $\quad$ Titrate 50.0 mL of $0.200 \mathrm{M} \mathrm{HNO}_{3}$ with 0.100 M NaOH . Determine the pH after $0.00,10.0$, 100 . and 150 . mL of NaOH has been added.
$\mathrm{HNO}_{3}$ is a strong acid, NaOH is a strong base; the equivalence point $\mathrm{pH}=7$
$\mathbf{V}_{\mathrm{sa}}=50.0 \mathrm{~mL}=0.0500 \mathrm{~L}$
$\mathbf{n}_{\text {sa }}=0.200 \mathrm{M} * 0.0500 \mathrm{~L}=\mathbf{0 . 0 1 0 0} \mathbf{~ m o l}$
$\mathrm{C}_{\mathrm{sb}}=\mathbf{0 . 1 0 0 ~ M}$
$\mathbf{V}_{\text {sb }}=0.0100 \mathrm{~mol} / 0.100 \mathrm{M}=0.100 \mathrm{~L}=\mathbf{1 0 0}$. $\mathbf{m L} \mathbf{N a O H}$ to the equivalence point
At 0.00 mL : Initial point: $\mathrm{pH}=-\log \left(\mathrm{n}_{\mathrm{sa}} / \mathrm{V}_{\mathrm{sa}}\right)=-\log (0.0100 \mathrm{~mol} / 0.0500 \mathrm{~L})=\mathbf{0 . 7 0}$
The pH reflects only the strong acid; no strong base has been added at this point.

At $10.0 \mathrm{~mL}: \quad$ Pre-equivalence point: $\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$
At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 1 0 0} \mathrm{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0100 \mathrm{~L}^{*} 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$

$$
\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)=-\log \left(\frac{0.0100-0.00100}{0.0500+0.0100}\right)=\mathbf{0 . 8 2}
$$

Note: $10.0 \mathrm{~mL}<100 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At 100. mL : $\quad$ Equivalence point, $\mathbf{p H}=\mathbf{7}$
At $100.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.100 \mathrm{~L} * 0.100 \mathrm{M}=0.0100 \mathrm{~mol}=\mathrm{n}_{\mathrm{sa}}$
Equal molar quantities of acid and base have been added; therefore,

$$
\mathrm{HNO}_{3}+\mathrm{NaOH} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NaNO}_{3}
$$

$\mathrm{NaNO}_{3}$ is a neutral salt, and the pH of water is 7 ; therefore, the equivalence pH is 7 .
At 150. $m L: \quad$ Post-equivalence point: $\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
At $150.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.150 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 1 5 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{sa}}$. This point lies in the postequivalence region, so:

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)=\mathbf{1 4}+\log \left(\frac{0.0150-0.0100}{0.150+0.0500}\right)=\mathbf{1 2 . 4 0}
$$

The titration graph for a strong acid + strong base would look like this:

Notice the sharp slope around the equivalence point region - this is indicative of strong acid + strong base titrations. Note that the equivalence point pH is $7.0-$ this is also what we would expect for this type of titration. Knowing how to predict the type of titration from a graph can be of considerable assistance to you in CH 223.

## Section Two: Strong Base + Strong Acid (SB + SA) Titration Equivalence Point $\mathbf{p H}=\mathbf{7}$ neutral

Analysis of this type of titration is very similar to the analysis for a Strong Acid + Strong Base (Section 1, above) except that the strong base will be dominant initially, followed by a slow erosion with a strong acid. Notice the subtle changes to the equations in this section when compared to section 1 ; you should see a pattern developing which can help you in your calculations.

## Before you begin:

As in section 1, strong bases titrated with strong acids will neutralize each other at the equivalence point. Therefore, you should expect to see a neutral pH when the quantity of base equals the quantity of acid added.

Determine the following quantities:
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base initially present
$\mathbf{n}_{\mathbf{s b}}=$ moles of strong base ( $=\mathrm{C}_{\mathrm{sb}} * \mathrm{~V}_{\mathrm{sb}}$ )
$\mathbf{C}_{\mathbf{s a}}=$ concentration of strong acid
$\mathbf{V}_{\mathrm{sa}}=$ volume of strong acid to reach equivalence point $\left(=\mathrm{n}_{\mathrm{sb}} / \mathrm{C}_{\mathrm{sa}}\right)$

## Analysis Section:

There are four regions in $\mathrm{SB}+\mathrm{SA}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\mathbf{n}_{\text {sb }} / \mathbf{V}_{\mathbf{s b}}\right)$

The pH will reflect the strong base only - no strong acid has been added.
Note the presence of " 14 " in the equation; this is due to the fact that:

$$
\begin{gathered}
\mathrm{pOH}=-\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right) \\
\text { and } \\
14=\mathrm{pH}+\mathrm{pOH}
\end{gathered}
$$

Combining these equations and solving for pH gives $\mathrm{pH}=14+\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right)$.

- Pre-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the remaining base in solution after some neutralization with strong acid. $\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{sa}}$ in this region.

- Equivalence: $\mathbf{p H}=\mathbf{7}$
$\mathrm{n}_{\mathrm{sb}}=\mathrm{n}_{\mathrm{sa}}$, so water and a neutral salt will be produced at this point.
- Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$

The pH will reflect the excess acid remaining after neutralizing the strong base.
$\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{sb}}$ in this region.

Example: $\quad$ Titrate $100 . \mathrm{mL}$ of 0.500 M NaOH with 1.00 M HCl . Determine the pH after $0.00,25.0$, 50.0 and 80.0 mL of NaOH has been added.

NaOH is a strong base, HCl is a strong acid; the equivalence point $\mathrm{pH}=7$
$\mathbf{V}_{\mathbf{s b}}=100 . \mathrm{mL}=\mathbf{0 . 1 0 0} \mathrm{L}$
$\mathbf{n}_{\mathbf{s b}}=0.500 \mathrm{M} * 0.100 \mathrm{~L}=\mathbf{0 . 0 5 0 0} \mathbf{~ m o l}$
$\mathrm{C}_{\mathrm{sa}}=\mathbf{1 . 0 0} \mathrm{M}$
$\mathbf{V}_{\mathbf{s a}}=0.0500 \mathrm{~mol} / 1.00 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ H C l}$ to the equivalence point
At $0.00 \mathrm{~mL}: \quad$ Initial point: $\mathrm{pH}=14+\log \left(\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right)=14+\log (0.0500 \mathrm{~mol} / 0.100 \mathrm{~L})=\mathbf{1 3 . 7 0}$
The pH reflects only the strong base; no strong acid has been added at this point.
At 25.0 mL : Pre-equivalence point: $\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)$
At $25.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sa}}=\mathbf{0 . 0 2 5 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sa}}=0.0250 \mathrm{~L} * 1.00 \mathrm{M}=\mathbf{0 . 0 2 5 0} \mathbf{~ m o l}$

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{s a}}{V_{s a}+V_{s b}}\right)=\mathbf{1 4}+\log \left(\frac{0.0500-0.0250}{0.100+0.0250}\right)=\mathbf{1 3 . 3 0}
$$

Note: $25.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
Notice how there is little pH change upon adding this much acid. Strong base + strong acid pH curves change slowly until the equivalence point is reached, then the change becomes quite noticeable.

At 50.0 mL : $\quad$ Equivalence point, $\mathbf{p H}=\mathbf{7}$
At $50.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0500 \mathrm{~L} * 1.00 \mathrm{M}=0.0500 \mathrm{~mol}=\mathrm{n}_{\mathrm{sb}}$
Equal molar quantities of base and acid have been added; therefore,

$$
\mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NaCl}
$$

NaCl is a neutral salt, and the pH of water is 7 ; therefore, the equivalence pH is 7 .
At $80.0 \mathrm{~mL}: \quad$ Post-equivalence point: $\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)$
At $80.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0800 \mathrm{~L}^{*} 1.00 \mathrm{M}=\mathbf{0 . 0 8 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{sb}}$. This point lies in the postequivalence region, so:

$$
\mathrm{pH}=-\log \left(\frac{n_{s a}-n_{s b}}{V_{s a}+V_{s b}}\right)=-\log \left(\frac{0.0800-0.0500}{0.0800+0.100}\right)=\mathbf{0 . 7 8}
$$

Notice how the pH changed rapidly between 25.0 mL of acid added (still quite basic) and 80.0 mL of acid added (where the pH is quite acidic). As the concentration of strong acids and bases increases, the titration curves will show a steeper equivalence point.

The titration graph for a strong base + strong acid would look like this:

As in section 1, notice the sharp slope around the equivalence point region - this is indicative of strong base + strong acid titrations. Note that the equivalence point pH is 7.0 - this is also what we would expect for this type of titration. At first, the NaOH dominated the titration, and the graph pH was quite basic. At the conclusion of the titration, HCl dominated and overcame the NaOH present in solution, and the pH became quite acidic. Remembering simple facts can aid your analysis of titrations in CH 223.

## Section Three: Weak Acid + Strong Base (WA + SB) Titration Equivalence Point pH $>\mathbf{7}$ basic

Weak acids and weak bases have incomplete ionization in solution, which is in marked contrast to their strong acid and strong base counterparts. For example, if we have a solution of 1.00 M HCl in water,

$$
\mathrm{HCl}_{(\mathrm{aq})} \rightarrow \mathrm{H}_{(\mathrm{aq})}^{+}+\mathrm{Cl}_{-(\mathrm{aq})}
$$

we would have $100 \%$ of the $\mathrm{HCl}_{(\mathrm{aq})}$ converted to $\mathrm{H}^{+}(\mathrm{aq})$ and $\mathrm{Cl}^{-(\mathrm{aq})}$; no HCl would remain in solution.
If we had a solution of $1.00 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ in water,

$$
\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2(\mathrm{aq})} \rightleftharpoons \mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-1}{ }_{(\mathrm{aq})}
$$

we would have roughly $99 \%$ of the $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ still present in solution; less than $1 \%$ of the $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2(\mathrm{aq})}$ would ionize into $\mathrm{H}^{+}{ }_{(\text {aq) }}$ and $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{-}(\mathrm{aq})$. Weak acids and weak bases do not ionize completely in solution. Recall that if $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ is our weak acid, $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2^{-}}$(aq) will be the conjugate base in this system. Strong acids and bases do not have effective conjugate acids or bases.

To account for the discrepancy in ionization behavior, we will use the acid equilibrium constant, $\mathbf{K}_{\mathrm{a}}$, and the base equilibrium constant, $\mathbf{K}_{\mathbf{b}}$, in our calculations. Recall that $\mathrm{K}_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ are related to $\mathbf{K}_{\mathbf{w}}$, the autoionization of water constant, by the following expression:

$$
\mathrm{K}_{\mathrm{w}}=\mathrm{K}_{\mathrm{a}} * \mathrm{~K}_{\mathrm{b}}
$$

To speed our calculations when the weak acid or weak base is present in excess, we can use the Henderson-Hasselbalch equation. We will use a slightly modified form in this section, but the generic equation is:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { CConj. base }\rfloor}{[\text { acid }]}
$$

where $\quad \mathrm{pH}=\mathrm{pH}$ of system
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log ($ acid dissociation constant for weak acid in buffer $)$
[Conj. base] = concentration or moles of base in solution
[acid] = concentration or moles of weak acid in solution
The Henderson-Hasselbalch equation tells us that when the moles of the strong base added equal onehalf the moles of weak acid initially present (i.e. ${ }^{1 / 2} n_{w a}=n_{\text {sb }}$ ), a special condition occurs; this point is called the half-equivalence point, and $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}$ here. Therefore, we need to add an additional region to our calculations, the half-equivalence region.

Before you begin: Determine the following quantities:
$\mathbf{V}_{\mathbf{w a}}=$ volume of weak acid initially present
$\mathbf{n}_{\mathrm{wa}}=$ moles of weak acid $\left(=\mathrm{C}_{\mathrm{wa}} * \mathrm{~V}_{\mathrm{wa}}\right)$
$\mathbf{K}_{\mathbf{a}}=$ acid dissociation constant for the weak acid
$\mathbf{p} \mathbf{K}_{\mathbf{a}}=-\log \mathrm{K}_{\mathbf{a}}$ (this is a just a unitless number)
$\mathbf{C}_{\mathbf{s b}}=$ concentration of strong base
$\mathbf{V}_{\mathbf{s b}}=$ volume of strong base to reach equivalence point ( $=\mathrm{n}_{\mathrm{wa}} / \mathrm{C}_{\mathrm{sb}}$ )
Also remember that at room temperature, $\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}$

Analysis Section: There are five regions in WA +SB titrations in which to calculate the pH :

- Initial Region: $\mathbf{p H}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}$

The pH will reflect the weak acid only - no strong base has been added. Recall that for weak acids,

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} \cdot C_{w a}}
$$

and $\mathrm{C}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{wa}} / \mathrm{V}_{\mathrm{wa}}$, just as $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$.

- Pre-Equivalence Region: $\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)$

Because $\mathrm{n}_{\mathrm{wa}}>\mathrm{n}_{\mathrm{sb}}$ in this region, the pH will be affected by two factors: 1 ) the remaining weak acid in the solution, and 2) the conjugate base present upon addition of strong base. For weak acids HA reacting with strong base NaOH ,

$$
\mathrm{HA}+\mathrm{NaOH} \rightarrow \mathrm{HOH}+\mathrm{Na}^{+}+\mathrm{A}^{-}
$$

The species A- is the conjugate base of the weak acid HA, and it will react with water to re-form the weak acid:

$$
\mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HA}+\mathrm{OH}^{-}
$$

The generation of $\mathrm{OH}^{-}$from the conjugate base will affect pH .
Fortunately, the weak acid / conjugate base system can be treated like a buffer; hence, the usefulness of the Henderson-Hasselbalch equation. Recall that the Henderson-Hasselbalch equation is

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { Conj. base }]}{[\text { acid }]}
$$

[Conj. base] and [acid] can be re-written as $\mathrm{n}_{\text {sb }}$ and ( $\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}$ ), respectively* , or

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}
$$

* Why? OK, here goes: for every mole of conjugate base created, an equal number of moles of strong base must be added, so [Conj. base] $=\mathrm{n}_{\mathrm{sb}}$. Also, the moles of weak acid present in solution will depend on how many moles of strong base have been added, so [acid] $=\left(n_{w a}-n_{s b}\right)$.

Note that there is no volume dependence in the pre-equivalence region; you need not calculate total volume, etc. in this region if using the Henderson-Hasselbalch equation.

- Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K}_{\mathbf{a}}$

At half-equivalence, $1 / 2 \mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{sb}}$, and the $\log$ term in the pre-equivalence equation goes to zero $(\log 1=$ $0)$. Note that you can predict the $p H$ of any weak acid system at half-equivalence by calculating the $p K_{a}$ !

- Equivalence: $\mathbf{p H}=\mathbf{1 4}+\log ^{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}$

At the equivalence point, $\mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{sb}}$, and the only factor affecting pH is the conjugate base (see discussion on pre-equivalence, above.) To find $\left[\mathrm{OH}^{-}\right]$for a weak base, use:

$$
\left[\mathrm{OH}^{-}\right]=\sqrt{K_{b} \cdot C_{w b}}=\sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}
$$

For every mole of weak acid, an equal number of moles of conjugate base are created; hence, $\mathrm{n}_{\mathrm{cb}}=\mathrm{n}_{\mathrm{wa}}$. The term $\mathrm{V}_{\mathrm{cb}}$ must take into account the total volume present in solution, hence, $\mathrm{V}_{\mathrm{cb}}=\mathrm{V}_{\mathrm{wa}}+\mathrm{V}_{\mathrm{sb}}$. $\mathrm{K}_{\mathrm{b}}$ can be rewritten as $\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a}}$.
Converting [ $\mathrm{OH}^{-}$] to pH provides the necessary equation

$$
\mathrm{pH}=14+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}
$$

Note that in titrations of weak acids with strong bases, the equivalence point pH will be affected by the pH of the conjugate base only; no weak acid remains in solution. Therefore, expect basic pH values at the equivalence point in weak acid + strong base titrations.

- Post-Equivalence Region: $\mathbf{p H}=\mathbf{1 4}+\log \left(\frac{n_{s b}-n_{w a}}{V_{s b}+V_{w a}}\right)$

The pH will reflect the excess strong base remaining after neutralizing the weak acid. ( $\mathrm{n}_{\mathrm{sb}}>\mathrm{n}_{\mathrm{wa}}$ )
Note that the contribution of the conjugate base will have no appreciable effect on the pH assuming even a small portion of strong base is present in solution; therefore, it is omitted from the calculation.

Example: $\quad$ Titrate 50.0 mL of $0.100 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\left(\mathrm{~K}_{\mathrm{a}}=1.80^{*} 10^{-5}\right)$ with 0.100 M NaOH . Determine the pH after $0.00,10.0,25.0,40.0,50.0$ and 60.0 mL of NaOH has been added.
$\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ is a weak acid, NaOH is a strong base; the equivalence point should be basic
$\mathbf{V}_{\mathrm{wa}}=50.0 \mathrm{~mL}=0.0500 \mathrm{~L}$
$\mathbf{n}_{\mathbf{w a}}=0.100 \mathrm{M}^{*} 0.0500 \mathrm{~L}=\mathbf{0 . 0 0 5 0 0} \mathbf{~ m o l}$
$\mathbf{C}_{\text {sb }}=\mathbf{0 . 1 0 0 ~ M}$
$\mathbf{V}_{\mathbf{s b}}=0.00500 \mathrm{~mol} / 0.100 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ N a O H}$ to the equivalence point
The half-equivalence point will be reached at $(50.0 \mathrm{~mL} / 2)$ or $\mathbf{2 5 . 0} \mathbf{~ m L ~ N a O H}$
$\mathbf{p K}_{\mathbf{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log \left(1.80^{*} 10^{-5}\right)=4.74$
At 0.00 mL : Initial point:

$$
\mathrm{pH}=-\log \sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}=-\log \sqrt{1.80 \times 10^{-5} \cdot \frac{0.00500}{0.0500}}=\mathbf{2 . 8 7}
$$

The pH reflects only the weak acid; no strong base has been added at this point.

Note how the initial pH of a weak acid is considerably more basic than the initial pH of a strong acid; this is due to the incomplete ionization of the weak acid (and the resulting dependency on $\mathrm{K}_{\mathrm{a}}$.)

At 10.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)=4.74+\log \left(\frac{0.00100}{0.00500-0.00100}\right)=4.14
$$

At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 1 0 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0100 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$
Note: $10.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At 25.0 mL : Half-equivalence point: $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}=\mathbf{4 . 7 4}$
This is a simple calculation but one which gives tremendous insight into the system being studied.
At 40.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{s b}}{n_{w a}-n_{s b}}\right)=4.74+\log \left(\frac{0.00400}{0.00500-0.00400}\right)=5.34
$$

At $40.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sb}}=\mathbf{0 . 0 4 0 0} \mathbf{L}$, and $\mathrm{n}_{\mathrm{sb}}=0.0400 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 4 0 0} \mathbf{~ m o l}$
Note: $40.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region

## At 50.0 mL : Equivalence point:

$$
\mathrm{pH}=14+\log \sqrt{\frac{K_{w}}{K_{a}} \cdot \frac{n_{w a}}{\left(V_{w a}+V_{s b}\right)}}=\mathbf{1 4}+\log \sqrt{\frac{\mathbf{1 0}^{-14}}{\mathbf{1 . 8 \times 1 0}} \cdot \frac{0.00500}{(0.0500+0.0500)}}=\mathbf{8 . 7 2}
$$

Note that this equation looks somewhat nasty, but really it's just a good old "plug and chug" equation. Notice how the equivalence pH is basic as predicted.

At 60.0 mL : Post-equivalence point:

$$
\mathrm{pH}=14+\log \left(\frac{n_{s b}-n_{w a}}{V_{s b}+V_{w a}}\right)=\mathbf{1 4}+\log \left(\frac{0.00600-0.00500}{0.0600+0.0500}\right)=\mathbf{1 1 . 9 6}
$$

At $60.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sb}}=0.0600 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 6 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{wa}}$. This point lies in the post-equivalence region.

The titration graph for a weak acid + strong base would look like the diagram below:

Note that the equivalence point is basic in a weak acid + strong base titration, a result of the conjugate base of the weak acid. Also note how the slope around the equivalence point is not as steep as it was when strong acids and bases were mixed together.

## Section Four: Weak Base + Strong Acid (WB + SA) Titration Equivalence Point pH $<7$ acidic

As discussed in section three ( $\mathrm{WA}+\mathrm{SB}$ ), weak acids and bases do not ionize completely in solution. For example, if we had a solution of $1.00 \mathrm{M} \mathrm{NH}_{3}$ (ammonia, a weak base) in water,

$$
\mathrm{NH}_{3(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}_{(\mathrm{aq})}
$$

we would have roughly $99 \%$ of the ammonia still present in solution; less than $1 \%$ of the $\mathrm{NH}_{3(\mathrm{aq})}$ would ionize with water into $\mathrm{NH}_{4}^{+}{ }_{(\mathrm{aq})}$ and $\mathrm{OH}^{-}(\mathrm{aq})$. Recall that $\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$ will be the conjugate acid in this system. This lack of complete ionization forces a dependency upon the base equilibrium constant, $\mathbf{K}_{\mathbf{b}}$, in our calculations.

As before, to speed our calculations when the weak base is present in excess, we can use the Henderson-Hasselbalch equation. We will use a slightly modified form for this section. The halfequivalence point will also be of use to use just as it was in the WA +SB titration.

## Before you begin:

## Determine the following quantities:

$\mathbf{V}_{\mathbf{w b}}=$ volume of weak base initially present
$\mathbf{n}_{\mathrm{wb}}=$ moles of weak base $\left(=\mathrm{C}_{\mathrm{wb}} * \mathrm{~V}_{\mathrm{wb}}\right)$
$\mathbf{K}_{\mathbf{b}}=$ base dissociation constant for the weak base
$\mathbf{p} \mathbf{K}_{\mathbf{b}}=-\log \mathrm{K}_{\mathbf{b}}$ (this is a just a unitless number)
$\mathbf{C}_{\mathrm{sa}}=$ concentration of strong acid
$\mathbf{V}_{\mathbf{s a}}=$ volume of strong acid to reach equivalence point $\left(=\mathrm{n}_{\mathrm{wb}} / \mathrm{C}_{\mathrm{sa}}\right)$
Also remember that at room temperature, $\mathbf{K}_{\mathbf{w}}=\mathbf{1 0}^{-14}$

## Analysis Section:

There are five regions in $\mathrm{WB}+\mathrm{SA}$ titrations that require specific approaches to calculate the pH :

- Initial Region: $\mathbf{p H}=\mathbf{1 4}+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}$

The pH will reflect the weak base only - no strong acid has been added. Recall that for weak bases,

$$
\left[\mathrm{OH}^{-}\right]=\sqrt{K_{b} \cdot C_{w b}}
$$

and $\mathrm{C}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{wb}} / \mathrm{V}_{\mathrm{wb}}$. Recall that $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$and that $\mathrm{pH}+\mathrm{pOH}=14$; therefore,

$$
\mathbf{p H}=14+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}
$$

- Pre-Equivalence Region: This region uses a modified version of the Henderson-Hasselbalch equation to calculate pH :

$$
\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)
$$

Because $\mathrm{n}_{\mathrm{wb}}>\mathrm{n}_{\mathrm{sa}}$ in this region, the pH will be affected by two factors: 1) the remaining weak base in the solution, and 2) the conjugate acid present upon addition of strong acid. For a weak base A- reacting with strong acid HCl ,

$$
\mathrm{A}^{-}+\mathrm{HCl} \rightarrow \mathrm{HA}+\mathrm{Cl}^{-}
$$

The species HA is the conjugate acid of the weak base $\mathrm{A}^{-}$, and it will react with water to re-form the weak acid:

$$
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{~A}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

The generation of $\mathrm{H}_{3} \mathrm{O}^{+}$from the conjugate acid will affect pH .
As in the weak acid / strong base scenario, the weak base / conjugate acid system can be treated like a buffer; hence, the usefulness of the Henderson-Hasselbalch equation. Recall that the Henderson-Hasselbalch equation is

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { Conj. base }]}{[\text { acid }]}
$$

We will modify the Henderson-Hasselbalch equation to our weakly basic system. [Conj. base] and [acid] can be re-written as ( $\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}$ ) and $\mathrm{n}_{\mathrm{sa}}$, respectively* , and since $\mathrm{pK}_{\mathrm{a}}+\mathrm{pK}_{\mathrm{b}}=14$, we can re-write our equation as

$$
\mathbf{p H}=\mathbf{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)
$$

* Why? OK, here goes: for every mole of conjugate acid created, an equal number of moles of strong acid must be added, so [acid] $=\mathrm{n}_{\text {sa }}$. Also, the moles of weak base present in solution will depend on how many moles of strong acid have been added, therefore [Conj. base] is ( $\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}$ ).

Note that there is no volume dependence in the pre-equivalence region; you need not calculate total volume, etc. in this region if using the Henderson-Hasselbalch equation.

## - Half-Equivalence Region: $\mathbf{p H}=\mathbf{p K} \mathbf{a}_{\mathbf{a}}$

At half-equivalence, $1 / 2 \mathrm{n}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{sa}}$, and the $\log$ term in the pre-equivalence equation goes to zero $(\log 1=$ $0)$. Note that you can predict the $p O H$ of any weak base system at half-equivalence by calculating the $p K_{b}$ or the pH via $p K_{a}$ ! Converting to pH requires a simple but necessary calculation.

- Equivalence: $\mathbf{p H}=-\log \sqrt{\frac{K_{w}}{K_{b}} \cdot \frac{n_{w b}}{\left(V_{w b}+V_{s a}\right)}}$

At the equivalence point, $\mathrm{n}_{\mathrm{wb}}=\mathrm{n}_{\mathrm{sa}}$, and the only factor affecting pH is the conjugate acid (see discussion on pre-equivalence, above.) To find $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$for a weak acid:

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} \cdot C_{w a}}=\sqrt{K_{a} \cdot \frac{n_{w a}}{V_{w a}}}
$$

For every mole of weak base, an equal number of moles of conjugate acid are created; hence, $\mathrm{n}_{\mathrm{wa}}=\mathrm{n}_{\mathrm{wb}}$. The term $\mathrm{V}_{\mathrm{wa}}$ must take into account the total volume present in solution, hence, $\mathrm{V}_{\mathrm{wa}}=\mathrm{V}_{\mathrm{wb}}+\mathrm{V}_{\mathrm{sa}}$. $\mathrm{K}_{\mathrm{a}}$ can be rewritten as $\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{b}}$.
Converting $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$to pH provides the necessary equation

$$
\mathrm{pH}=-\log \sqrt{\frac{K_{w}}{K_{b}} \cdot \frac{n_{w b}}{\left(V_{w b}+V_{s a}\right)}}
$$

Note that in titrations of weak bases with strong acids, the equivalence point pH will be affected by the pH of the conjugate acid only; no weak base or strong acid remains in solution. Therefore, expect acidic pH values at the equivalence point in weak base + strong acid titrations.

- Post-Equivalence Region: $\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right)$

The pH will reflect the excess strong acid remaining after neutralizing the weak base.
$\mathrm{n}_{\mathrm{sa}}>\mathrm{n}_{\mathrm{wb}}$ in this region.
Note that the contribution of the conjugate acid will have no appreciable effect on the pH assuming even a small portion of strong acid is present in solution; therefore, it is omitted from the calculation.

Example: $\quad$ Titrate $100 . \mathrm{mL}$ of $0.0500 \mathrm{M} \mathrm{NH}_{3}\left(\mathrm{~K}_{\mathrm{b}}=1.80^{*} 10^{-5}\right)$ with 0.100 M HCl . Determine the pH after $0.00,10.0,25.0,50.0$ and 60.0 mL of HCl has been added.
$\mathrm{NH}_{3}$ is a weak base, HCl is a strong acid; the equivalence point should be acidic
$\mathbf{V}_{\mathbf{w b}}=100 . \mathrm{mL}=\mathbf{0 . 1 0 0} \mathrm{L}$
$\mathbf{n}_{\mathbf{w b}}=0.0500 \mathrm{M}^{*} 0.100 \mathrm{~L}=\mathbf{0 . 0 0 5 0 0} \mathbf{~ m o l}$
$\mathbf{C}_{\mathrm{sa}}=\mathbf{0 . 1 0 0} \mathrm{M}$
$\mathbf{V}_{\mathbf{s a}}=0.00500 \mathrm{~mol} / 0.100 \mathrm{M}=0.0500 \mathrm{~L}=\mathbf{5 0 . 0} \mathbf{~ m L ~ H C l}$ to the equivalence point
The half-equivalence point will be reached at $(50.0 \mathrm{~mL} / 2)$ or $\mathbf{2 5 . 0} \mathbf{~ m L ~ H C l}$
$\mathbf{p K} \mathbf{K}_{\mathbf{a}}=-\log \left(\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{b}}\right)=-\log \left(10^{-14} / 1.80^{*} 10^{-5}\right)=\mathbf{9 . 2 6}$
At 0.00 mL : Initial point:

$$
\mathrm{pH}=14+\log \sqrt{K_{b} \cdot \frac{n_{w b}}{V_{w b}}}=\mathbf{1 4}+\log \sqrt{1.8 \times 10^{-5} \cdot \frac{0.00500}{0.100}}=\mathbf{1 0 . 9 8}
$$

The pH reflects only the weak base; no strong acid has been added at this point.
Note how the initial pH of a weak base is considerably more acidic than the initial pH of a strong base; this is due to the incomplete ionization of the weak base (and the resulting dependency on $\mathrm{K}_{\mathrm{b}}$.)

At 10.0 mL : Pre-equivalence point:

$$
\mathrm{pH}=\mathrm{p} K_{a}+\log \left(\frac{n_{w b}-n_{s a}}{n_{s a}}\right)=\mathbf{9 . 2 6}+\log \left(\frac{0.00500-0.00100}{0.00100}\right)=\mathbf{9 . 8 6}
$$

At $10.0 \mathrm{~mL}, \mathrm{~V}_{\mathrm{sa}}=\mathbf{0 . 0 1 0 0} \mathrm{L}$, and $\mathrm{n}_{\mathrm{sa}}=0.0100 \mathrm{~L}^{*} 0.100 \mathrm{M}=\mathbf{0 . 0 0 1 0 0} \mathbf{~ m o l}$
Note: $10.0 \mathrm{~mL}<50.0 \mathrm{~mL}$ (equivalence point), so this point is in the pre-equivalence region
At $25.0 \mathrm{~mL}: \quad$ Half-equivalence point: $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}=14-\mathrm{pK}_{\mathrm{b}}=14-4.74=\mathbf{9 . 2 6}$
Although simple, this calculation gives tremendous insight into the system being studied.
At 50.0 mL : Equivalence point:

Note that this equation looks somewhat nasty, but really it's just a good old "plug and chug" equation. All of the values have been calculated, and the application will become easier with time.

Notice how the equivalence point pH is acidic as predicted.

## At 60.0 mL : Post-equivalence point:

$$
\mathbf{p H}=-\log \left(\frac{n_{s a}-n_{w b}}{V_{s a}+V_{w b}}\right)=-\log \left(\frac{0.00600-0.00500}{0.0600+0.100}\right)=\mathbf{2 . 2 0}
$$

At $60.0 \mathrm{~mL}, \mathrm{n}_{\mathrm{sa}}=0.0600 \mathrm{~L} * 0.100 \mathrm{M}=\mathbf{0 . 0 0 6 0 0} \mathbf{~ m o l}$, which is larger than $\mathrm{n}_{\mathrm{wb}}$. This point lies in the post-equivalence region.

The titration graph for a weak base + strong acid would look like this:

Note that the equivalence point is acidic in a weak base + strong acid titration, a result of the conjugate acid of the weak base. Also note how the slope around the equivalence point is not as steep as it was when strong acids and bases were mixed together.

## CH 223 Titration Calculations - The Problems

Exercises: Complete these problems using the worksheet on the next page. Also, construct a graph of pH versus Volume of Titrant for each problem. Staple calculations to the back of the worksheet on separate paper. All pH calculations should be reported to the hundredths place.

1. You wish to titrate 50.00 mL of a 0.100 M HCl solution with 0.100 M NaOH . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 10.00 \mathrm{~mL}, 20.00 \mathrm{~mL}, 40.00 \mathrm{~mL}, 45.00 \mathrm{~mL}, 48.00 \mathrm{~mL}, 49.00 \mathrm{~mL}, 50.00 \mathrm{~mL}, 51.00 \mathrm{~mL}$, $55.00 \mathrm{~mL}, 60.00 \mathrm{~mL}, 80.00 \mathrm{~mL}$ and 100.00 mL of NaOH . Plot the results of your calculations as pH versus mL of NaOH added.
2. You wish to titrate 38.00 mL of a 0.1680 M KOH solution with $0.1120 \mathrm{M} \mathrm{HNO}_{3}$. Calculate the pH after the addition of $0.00 \mathrm{~mL}, 5.00 \mathrm{~mL}, 12.70 \mathrm{~mL}, 29.99 \mathrm{~mL}, 51.00 \mathrm{~mL}, 55.50 \mathrm{~mL}, 57.00 \mathrm{~mL}, 61.20 \mathrm{~mL}, 74.70 \mathrm{~mL}$, $82.20 \mathrm{~mL}, 88.50 \mathrm{~mL}, 92.30 \mathrm{~mL}$ and 100.00 mL of $\mathrm{HNO}_{3}$. Plot the results of your calculations as pH versus mL of $\mathrm{HNO}_{3}$ added.
3. A 25.00 mL solution of 0.100 M lactic acid $\left(\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{3}, \mathrm{pK}_{\mathrm{a}}=3.85\right)$ is titrated with 0.100 M LiOH . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 4.00 \mathrm{~mL}, 8.00 \mathrm{~mL}, 12.50 \mathrm{~mL}, 20.00 \mathrm{~mL}, 24.00 \mathrm{~mL}, 24.50$ $\mathrm{mL}, 25.00 \mathrm{~mL}, 26.00 \mathrm{~mL}, 28.00 \mathrm{~mL}, 30.00 \mathrm{~mL}, 35.00 \mathrm{~mL}$ and 40.00 mL of LiOH. Plot the results of your calculations as pH versus mL of LiOH added.
4. A student titrates 29.00 mL of 0.2250 M pyridine $\left(\mathrm{K}_{\mathrm{b}}=1.7^{*} 10^{-9}\right)$ with 0.3750 M HBr . Calculate the pH after the addition of $0.00 \mathrm{~mL}, 2.00 \mathrm{~mL}, 3.60 \mathrm{~mL}, 5.00 \mathrm{~mL}, 6.50 \mathrm{~mL}, 8.70 \mathrm{~mL}, 9.90 \mathrm{~mL}, 10.00 \mathrm{~mL}, 10.80$ $\mathrm{mL}, 15.00 \mathrm{~mL}, 17.40 \mathrm{~mL}, 18.70 \mathrm{~mL}$ and 36.00 mL of HBr . Plot the results of your calculations as pH versus mL of HBr added.
$\qquad$
Provide answers to the questions (found on the previous page) using the sheet below.

- Report all pH values to the hundredths place.
- Circle the equivalence point and the half-equivalence point (if appropriate) volume on the handout
- Include computer generated graphs (using Excel, etc.) of the titrations and all necessary calculations on separate paper stapled to the back of this handout.

| Question \#1 |  | Question \#2 |  | Question \#3 |  | Question \#4 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Volume NaOH | pH | Volume $\mathrm{HNO}_{3}$ | pH | Volume LiOH | pH | Volume HBr | pH |
| 0.00 |  | 0.00 |  | 0.00 |  | 0.00 |  |
| 10.00 |  | 5.00 |  | 4.00 |  | 2.00 |  |

## This page left blank for printing purposes

# CH 223 Spring 2024: <br> "Acid \& Base Titrations <br> (online)" Lab-Instructions 

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section $\mathrm{H1}$ of CH 223 , please use this link: http://mhchem.org/q/5a.htm

Step One:
Watch the lab video for the "Acid \& Base Titrations" lab, found here: http://mhchem.org/v/f.htm
Record the data found at the end of the lab video on the appropriate page.

Step Two:
Complete pages Ib-5-7 through Ib-5-10 using the "Acid \& Base Titrations" video and the actual lab instructions on pages $\mathrm{Ib}-5-2$ through $\mathrm{Ib}-5-5$. Include your name on page Ib-5-7!

Step Three:
Submit your lab (pages Ib-5-7 through Ib-5-10 only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, May 1 by 11:59 PM. I recommend a free program (ex: CamScanner, https://camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Acid \& Base Titrations

During the next several labs you will perform titrations on acids and bases to determine various properties about these solutions. This first lab is designed as an introduction to titration with acids and bases. The focus of this lab will be to familiarize you with the Vernier computer system and to perform a titration using it. The program you use can be modified as needed in the following lab classes.

A titration is a process by which a solution of known concentration is quantitatively added to a solution of unknown concentration in order to determine its concentration. You will be using burets to perform the titrations. The titration end point or equivalence point is when stoichiometrically equivalent amounts of the two substances are present. Therefore, it is necessary to create a method for determining the endpoint of the titration. In an acid-base titration, the change in the acidity or pH of the solution is a convenient method to determine this equivalence point.

There are two methods to measure the pH of a solution. In the first method a chemical called an indicator is used that changes color upon a change in the acidity of the solution. Litmus and phenolphthalein are examples of common indicators. The second method is to use a $\mathbf{p H}$ meter to measure the pH of the solution as the titration proceeds.

In this lab you will use a Vernier interface with a pH probe to measure the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$of the solution. The program will graph the progress of the titration as the titrant is added from the buret (measured with a drop counter.) A plot of the pH of a solution against the volume of titrant added is called a titration curve. From the titration curve, the equivalence point can be determined as the point of maximum slope. For an acid-base titration, the equivalence point occurs when moles of acid equal moles of base: $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{-}\right]$. Furthermore, the equivalence point will reveal whether the solution consists of a strong or weak acid.

For an acid, HA, in solution, the equilibrium constant $\mathrm{K}_{\mathrm{a}}$ for the process can be determined:

$$
\mathrm{HA}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}_{(\mathrm{aq})}^{+}+\mathrm{A}_{(\mathrm{aq})}^{-} \quad \mathrm{K}_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}+\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}
$$

Recall that in solution, there is also a second equilibrium of concern:

$$
2 \mathbf{H}_{2} \mathrm{O} \rightleftharpoons \mathbf{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}, \quad \mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=\mathbf{1 . 0 0} * \mathbf{1 0}^{-14}
$$

For a strong acid, $\mathrm{K}_{\mathrm{a}}$ is so large that the acid dissociates completely into $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{A}^{-}$such that $[\mathrm{HA}]=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ even in the untitrated state. At equivalence, the dissociation of water governs the pH , and the $\mathrm{pH}=7$.

For a weak acid, $\mathrm{K}_{\mathrm{a}}$ is small and hence influences the pH . The initial pH of the solution will appear higher than that of a strong acid and the pH at the equivalence point is not 7. To calculate $\mathrm{K}_{\mathrm{a}}$, you will need to determine the pH halfway to the equivalence point. At the halfway point or half equivalence point, half of the acid has been titrated such that $\left[A^{-}\right]=[H A]$. This will reduce the equilibrium expression to $\mathrm{K}_{\mathrm{a}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$or $\mathbf{p H}=\mathbf{p} \mathbf{K}_{\mathbf{a}}$. Therefore, if the volume at the equivalence point is determined, the pH at half that volume will reveal $\mathrm{pK}_{\mathrm{a}}$.

## PERFORMING THE EXPERIMENT:

You will use a Vernier interface and equipment to titrate three acids using NaOH. Note the setup of the Vernier equipment carefully; you shall perform several similar titrations during this lab period and in the weeks to come. At the end, upload your graphs (and maybe data files) to your email account and analyze them later at your convenience.

1. Obtain approximately 65 mL of NaOH solution in a 250 mL beaker.
2. Obtain a 25 or 50 mL buret and connect it to a ring stand using a buret clamp. Rinse the buret with a few mL of the NaOH and discard into a waste jar. Now fill the buret to the 0.00 mL line. Drain a small amount of NaOH solution into the 250 mL beaker so it fills the buret's tip. Use a disposable pipet to ensure the NaOH volume is still at 0.00 mL .
3. Connect the pH Sensor to CH 1 of the Vernier LabQuest 2 Interface. Lower the Drop Counter onto a ring stand and connect it to DIG 1. Choose New from the File menu.
4. Calibrate the Drop Counter so that a precise volume of titrant is recorded in units of milliliters.
a. Choose Sensors Calibrate Drop Counter from the Sensors menu. If you do not see the
"Sensors" entry at the top, push the "Meter" icon in the upper left corner.
-If you have previously calibrated the drop size of your buret and want to continue with the same drop size, tap Equation after selecting the "Drop Counter" in the "Calibrate" menu. Enter the value for drops/ mL . Select Done, then OK. Proceed directly to the next section.
-If you want to perform a new calibration (i.e. if you change burets), continue with this step.
b. Select Calibrate Now.
c. Place a 10 mL graduated cylinder directly below the slot on the Drop Counter, lining it up with the tip of the buret.
d. Open the valve on the buret. Slowly add NaOH from the buret at a slow rate ( $\sim 1$ drop every second). You should see the drops being counted on the screen.
e. When the volume of NaOH solution added from the buret is between 3 and 9 mL , close the buret.
f. Enter the precise Volume of NaOH to 0.01 mL . Select Done. Record the number of drops $/ \mathrm{mL}$ displayed on the screen (Sensors Calibrate Drop Counter then Equation) for possible future use. Select OK.
g. It's also recommended to calibrate the $\mathbf{p H}$ meter (Sensors Calibrate $\rightarrow \mathbf{p H}$ Meter). Use a two point calibration (at pH of 4 and 10 using buffer solutions in small beakers.)
5. Discard the NaOH solution in the graduated cylinder and set it aside. Fill the NaOH in the buret to the 0.00 mL level.
6. Using a graduated cylinder, measure 5.00 mL HCl (record the concentration!) into a 250 mL beaker. Add about 100 mL of water.
7. Assemble the apparatus.
a. Place a magnetic stirrer under or near the ring stand with the buret. Place a stir bar in the 250 mL beaker with the HCl and place it on the magnetic stirrer.
b. Rinse the pH sensor with water, then insert it through the large hole in the Drop Counter and attach it to the ring stand. Make sure the stir bar does not touch the bulb of the pH sensor.
c. Adjust the positions of the Drop Counter and buret so they are both lined up. Test the positioning by releasing a few drops of NaOH ; if the red light on the drop counter appears and disappears, all is well; if not, readjust the buret so the drops are counted. Also make sure the pH Sensor is just touching the bottom of the beaker.

8. Turn on the magnetic stirrer so that the stir bar is stirring at a fast rate, but not hitting the pH sensor bulb.
9. You are now ready to begin collecting data! Check to see that the pH value is acidic (you are starting with an acid.)
10. Start data collection by pressing the "start" button (the green arrow in the corner of the LabQuest.) No data will be collected until the first drop goes through the Drop Counter slot. Open the buret valve so that about 1 drop is released every 1 second or so. When the first drop passes through the Drop Counter slot, check the graph to see that the first data pair was recorded.
11. Continue watching your graph to see when a large increase in pH takes place-this will be the equivalence point of the reaction. When this jump in pH occurs, let the titration proceed for several more milliliters of titrant, then stop data collection (the red square in the corner) to view the graph of pH vs. volume. Make sure you see the " $S$ " curve (or more if the acid is polyprotic.)
12. Dispose of the beaker contents in a waste jar, remembering not to put the stir bar in the waste jar.
13. Examine the data on the displayed graph of pH vs. volume (in mL ) using your finger or the stylus to estimate the equivalence point volume and pH . Record the $\mathbf{p H}$ value in your notebook and record the $\mathbf{N a O H}$ volume in $\mathbf{m L}$ at the equivalence point. Note: if this is a weak acid graph, also record the half equivalence volume and the half equivalence pH value.
14. Email copies of each graph to at least one member of your group. You will need to include a printed copy of each graph in your lab report, so make sure you get a copy (from your lab partner, etc.) In the LabQuest app, select (upper left corner) File -> Email -> Graph, fill out the "To" line (and maybe the CC: line(s)), then select "Send."
15. Optional step for Excel power users: You can make your own graph; to do so, File -> Email -> Text File, send it to yourself, then import into Excel (the data file is a Tab delimited text file) and create an xy-scatter graph.... if you try this optional step and get stuck, email the instructor. Do not email yourself the "Data File" unless you have the Vernier software installed on your device.
16. You are now done with Experiment $\# 1(\mathrm{HCl}+\mathrm{NaOH})$. ©
17. Experiment \#2 will be similar, but this time with acetic acid. Repeat the above procedure with HCl but substitute acetic acid for HCl (use the same volumes, etc.) Make sure to rinse the $\mathbf{p H}$ meter with water before inserting it into a new solution. Remember to record the acetic acid concentration!
18. Experiment \#3 will be similar, but this time with phosphoric acid. Repeat the above procedure with HCl but substitute phosphoric acid for HCl (use the same volumes, etc.) Remember to record the phosphoric acid concentration! Make sure your pH at the end of the titration if quite basic.... this is a polyprotic acid, and the graph should look quite different.

You will be analyzing the data obtained in the experiment throughout the lab session. Therefore, it is imperative that you name your data files using different file names. You might call the first experiment "StrongAcid", the second "WeakAcid" and the third "PolyAcid" to distinguish the different files easily.

## ANALYSIS OF THE TITRATION CURVES / CALCULATIONS:

## The $\mathrm{HCl}-\mathrm{NaOH}$ Data

Include a printed graph of the $\mathrm{HCl}-\mathrm{NaOH}$ data with your lab report and label it appropriately if necessary. Determine the equivalence point volume and $\mathbf{p H}$ from the graph - they should be similar values to your estimated values you recorded earlier. Using the equivalence point volume and the exact concentration of the HCl , determine the molarity of the pure (initial) $\mathbf{N a O H}$ solution (i.e. before the NaOH reacted with the HCl .)

## The Acetic Acid - NaOH Data

Include a printed graph of the acetic acid- NaOH data with your lab report and label it appropriately if necessary. Determine the equivalence point volume and pH from the graph. Based on the volume added at the equivalence point, record the $\mathbf{p H}$ and volume at the half-equivalence point. Determine the $\mathbf{K}_{\mathrm{a}}$ value based on the half equivalence point data.

## The Phosphoric Acid - NaOH Data

Include a printed graph of the phosphoric acid- NaOH data with your lab report and label it appropriately if necessary.

Record the volume and $\mathbf{p H}$ values at the two equivalence points for the phosphoric acid solution. (In most cases, you will not be able to observe the third equivalence point.) Use your data and/or graphs to determine the exact equivalence points.

Record the $\mathbf{p H}$ and volume at each half-equivalence point. Determine the value of $K_{a 1}$ and $K_{a 2}$ using the two half equivalence point values on your graph. Note that to find $\mathrm{K}_{\mathrm{a} 2}$, take the mid-point volume between the first equivalence point and the second equivalence point.

## Acid \& Base Titrations - Worksheet

Do not submit any graphs with this assignment.

## Your name:

Purpose: To explore acid-base pH titrations for three types of acid + strong base systems.

Goal \#1: Watch the following video related to this lab: http://mhchem.org/v/f.htm

## Goal \#2: The $\mathbf{H C l}+\mathbf{N a O H}$ titration

View the graph for this titration here: http://mhchem.org/v/GA.pdf
$\mathbf{H C l}$ is a: strong acid strong base weak acid weak base (Circle one)
$\mathbf{N a O H}$ is a: strong acid strong base weak acid weak base (Circle one)
What should be the equivalence point pH be for this experiment?
less than 7 equal to 7 greater than 7 (Circle one)

Assume it takes 2.80 mL of 0.1100 M NaOH to titrate 5.00 mL of HCl . Calculate the concentration of HCl using this data (and show your work!)

## Goal \#3: The acetic acid $+\mathbf{N a O H}$ titration

View the graph for this titration here: http://mhchem.org/v/GB.pdf
acetic acid is a: strong acid strong base weak acid weak base (Circle one)
What should be the equivalence point pH be for this experiment?
less than $7 \quad$ equal to $7 \quad$ greater than 7 (Circle one)

Why is the half-equivalence pH (and half-equivalence volume) important in this titration? Explain.

From the graph, estimate the half-equivalence volume: $\qquad$ mL

From the graph, estimate the half-equivalence pH : $\qquad$

Using these values, calculate the value of $\mathrm{K}_{\mathrm{a}}$ for acetic acid: $\qquad$

Acetic acid has a known $\mathrm{K}_{\mathrm{a}}$ of $1.8 \times 10^{-5}$ via the literature. Find the percent error for this experiment. Recall: Percent error $=$ absolute value $\{($ actual - experimental $) /$ actual $\} * \mathbf{1 0 0 \%}$

Draw the Lewis structure of acetic acid showing all bonds and lone pair electrons.

## Goal \#4: The phosphoric acid +NaOH titration

View the graph for this titration here: http://mhchem.org/v/GC.pdf phosphoric acid is a: strong acid strong base weak acid weak base (Circle one)

From the graph, estimate the first half-equivalence volume: $\qquad$ mL

From the graph, estimate the first half-equivalence pH : $\qquad$

Using this value, calculate the value of $\mathrm{K}_{\mathrm{a} 1}$ for phosphoric acid: $\qquad$

Write the balanced equation used for $\mathrm{K}_{\mathrm{a} 1}$ of phosphoric acid

$$
\mathbf{H}_{3} \mathbf{P O}_{4}(\mathbf{a q})+\mathbf{H}_{2} \mathbf{O}(\mathbf{l}) \rightleftharpoons+
$$

From the graph, estimate the second half-equivalence volume: $\qquad$ mL

From the graph, estimate the second half-equivalence pH : $\qquad$

Using this value, calculate the value of $\mathrm{K}_{\mathrm{a} 2}$ for phosphoric acid: $\qquad$

Write the balanced equation used for $\mathrm{K}_{\mathrm{a} 2}$ of phosphoric acid:

## Postlab Questions:

1. If you titrate 100 mL of an unknown strong acid solution with 0.1 M NaOH , will the pH ever reach a value of 13? Explain.
2. What should the pH value be for the third half-equivalence point for phosphoric acid? Explain. Calculate what the exact value should be by using the table of acid dissociation constants in problem set \#2.
3. What is the molarity of an HCl solution if 25.00 mL of the acid solution required 42.68 mL of 0.2525 M NaOH solution to reach the equivalence point?
4. A student titrates 50.0 mL of a weak acid, HA, with 0.100 M NaOH . It requires 43.68 mL of 0.100 M NaOH to reach the equivalence point of the titration.
a. Calculate the moles of HA present.
b. Calculate the original (undiluted) concentration of the weak acid solution.
c. It took 21.84 mL of 0.100 M NaOH to reach the half-equivalence point for this reaction, and the pH of the solution at this point was 6.00 . Calculate the $K_{a}$ for the weak acid.

# CH 223 Spring 2024: <br> "Titration of Weak Acids <br> (online)" Lab-Instructions 

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or section H1 of CH 223, please use this link: http://mhchem.org/q/6a.htm

Step One:
Watch the lab video for the "Weak Acids" lab, found here:
http://mhchem.org/v/h.htm
Record the data found at the end of the lab video on page Ib-6-3.

Step Two:
Complete pages Ib-6-3 through Ib-6-4 using the "Weak Acids" video. Include your name on page Ib-6-3!

Step Three:
Submit your lab (pages Ib-6-3 through Ib-6-4 only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, May 8 by 11:59 PM. I recommend a free program (ex: CamScanner, https://camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## This page left blank for printing purposes

Complete the following questions. All work must be shown to receive full credit.

1. Obtain from the video

Collect the following data from the "Titration of a Weak Acid" video (http://mhchem.org/v/h.htm)

## [ NaOH ] (M): <br> $\qquad$

## Determination of $K_{\text {sp }}, \Delta G^{\circ}, \Delta H^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ for $\mathrm{Ca}(\mathbf{O H})_{2}$

The solubility of hydroxides is easily determined through a titration with a suitable acid (such as HCl ). From the molar solubility, the solubility equilibrium constant, $\mathrm{K}_{\text {sp }}$, can be calculated and from this the $\Delta \mathrm{G}^{\circ}$ for the dissolution of the material can be determined. Using $\Delta \mathrm{G}^{\circ}$ values at two different temperatures and noting that the values of $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ are relatively invariant over small temperature ranges, the enthalpy and entropy changes can also be estimated. With knowledge of these constants, $\Delta \mathrm{G}^{\circ}$ and $\mathrm{K}_{\text {sp }}$ can be calculated at any temperature between $0{ }^{\circ} \mathrm{C}$ and $100^{\circ} \mathrm{C}$.

## THE REACTION:

The solubility of an ionic substance in a solvent can be thought of as a reaction where the solid dissociates into ions in solution. In this experiment, the solubility of calcium hydroxide will be determined, as suggested in the reaction shown below.

$$
\mathrm{Ca}(\mathrm{OH})_{2(\mathrm{~s})} \rightleftharpoons \mathrm{Ca}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{OH}_{-(\mathrm{aq})}^{-}
$$

Once equilibrium has been established and the solid removed, the concentration of hydroxide can be easily determined via an acid/base titration. Hydrochloric acid will be used to find the concentration of $\mathrm{OH}^{-}$(aq).

$$
\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{OH}_{-(\mathrm{aq})}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}+\mathrm{Cl}^{-(\mathrm{aq})}
$$

Note that the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ is half of the $\mathrm{OH}^{-}$concentration found by titration.

## Determination of $\mathbf{K}_{\text {sp }}, \Delta \mathbf{G}^{\circ}, \Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$

The concentration of hydroxide ion in a saturated solution of $\mathrm{Ca}(\mathrm{OH})_{2}$ is found by titration with standardized hydrochloric acid. Since HCl is a strong acid and $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$react with $1: 1$ stoichiometry, we can use:

$$
\mathrm{M}_{\mathrm{HCl}} \mathrm{~V}_{\mathrm{HCl}}=\mathrm{M}_{\mathrm{OH}}-\mathrm{V}_{\mathrm{OH}-}
$$

where MHCl and $\mathrm{Moh}_{\mathrm{H}}$ are the molarities and $\mathrm{V}_{\mathrm{HCl}}$ and $\mathrm{VOH}_{\mathrm{OH}}$ are the volumes of the acid and hydroxide solutions, respectively. The molar solubility of the salt is equal to half of the hydroxide ion concentration

The equilibrium constant, $\mathbf{K}_{\text {sp }}$, for $\mathrm{Ca}(\mathrm{OH})_{2}$ is:

$$
K_{\text {sp }}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}
$$

Remember that the calcium ion concentration is half the hydroxide ion concentration determined by the titration.

The Gibbs Free Energy, $\Delta \mathbf{G}^{\circ}$, is related to the equilibrium constant $\left(\mathrm{K}_{\text {sp }}\right)$ by

$$
\Delta \mathbf{G}^{\circ}=-\mathbf{R T} \ln K_{\text {sp }}
$$

where $\mathbf{R}$ is the ideal gas constant $(\mathrm{R}=8.3145 \mathrm{~J} / \mathrm{mol}-\mathrm{K})$ and $\mathbf{T}$ is the absolute temperature in Kelvin.

To find the enthalpy ( $\Delta \mathbf{H}^{\circ}$ ) and entropy ( $\Delta \mathbf{S}^{\circ}$ ) changes, the following equation is used

$$
\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}
$$

where $\mathbf{T}$ is the absolute temperature. We assume that $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ do not change significantly with temperature which is usually true for this small of a temperature change. Using the free energies $\left(\Delta G^{\circ}\right)$ found for two different temperatures, $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ values are found by solving for two unknowns in two equations.

## Example:

Consider the solubility of $\mathrm{Sr}(\mathrm{OH})_{2}$. Two solutions of $\mathrm{Sr}(\mathrm{OH})_{2}$ are allowed to equilibrate, one at $0{ }^{\circ} \mathrm{C}$ and the other at $25^{\circ} \mathrm{C}$. A 10.00 mL aliquot of each solution is titrated with 0.2000 M HCl .3 .37 mL of the acid are required for the $0{ }^{\circ} \mathrm{C}$ solution, and 62.90 mL are required for the $25^{\circ} \mathrm{C}$ solution.

At $0{ }^{\circ} \mathrm{C}$, the $\left[\mathrm{OH}^{-}\right]$is found using:

$$
\left[\mathrm{OH}^{-}\right]=\left([\mathrm{HCl}] * \mathrm{~V}_{\mathrm{HCl}}\right) / \mathrm{V}_{\mathrm{OH}-}=(0.2000 \mathrm{M} * 3.37 \mathrm{~mL}) / 10.00 \mathrm{~mL}=\mathbf{0 . 0 6 7 4} \mathbf{~ M}
$$

Thus, the molar solubility of $\mathrm{Sr}(\mathrm{OH})_{2}$ at $0^{\circ} \mathrm{C}$ is $0.0674 / 2=\mathbf{0 . 0 3 3 7} \mathbf{~ M} . \mathrm{K}_{\text {sp }}$ at $0{ }^{\circ} \mathrm{C}$ can then be found:

$$
\mathbf{K}_{\mathbf{s p}}=\left[\mathrm{Sr}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=[0.0337][0.0674]^{2}=\mathbf{1 . 5 3} * \mathbf{1 0}^{-4}
$$

$\Delta \mathrm{G}^{\circ}$ can be determined at $0{ }^{\circ} \mathrm{C}(273 \mathrm{~K})$ :

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{~K}_{\mathrm{sp}}=-(8.3145)(273) \ln \left(1.53 * 10^{-4}\right)=\mathbf{1 9 . 9} \mathbf{~ k J} / \mathbf{m o l}
$$

Similarly, the molar solubility at $25^{\circ} \mathrm{C}$ is found to be $0.6290 \mathrm{M} ; \mathrm{K}_{\text {sp }}$ is 0.995 ; and $\Delta \mathrm{G}^{\circ}$ is $0.0124 \mathrm{~kJ} / \mathrm{mole}$.
Now we can determine $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ using the values of $\Delta \mathrm{G}^{\circ}$ at two temperatures:

$$
\begin{gathered}
\Delta \mathrm{G}^{\circ}=19.9 \mathrm{~kJ} / \mathrm{mole}=\Delta \mathrm{H}^{\circ}-\left(273 * \Delta \mathrm{~S}^{\circ}\right) \\
\Delta \mathrm{G}^{\circ}=0.0124 \mathrm{~kJ} / \mathrm{mole}=\Delta \mathrm{H}^{\circ}-\left(298 * \Delta \mathrm{~S}^{\circ}\right)
\end{gathered}
$$

Subtracting the second equation from the first provides

$$
\begin{gathered}
19.9 \mathrm{~kJ} / \mathrm{mol}-0.0124 \mathrm{~kJ} / \mathrm{mol}=\Delta \mathrm{H}^{\circ}-\Delta \mathrm{H}^{\circ}-\left(273 * \Delta \mathrm{~S}^{\circ}\right)+\left(298 * \Delta \mathrm{~S}^{\circ}\right) \\
19.9 \mathrm{~kJ} / \mathrm{mole}=25 \Delta \mathrm{~S}^{\circ}
\end{gathered}
$$

so $\Delta \mathrm{S}^{\circ}=0.80 \mathrm{~kJ} /$ mole- K . Using this value of $\Delta \mathrm{S}^{\circ}$ at either temperature gives $\Delta \mathrm{H}^{\circ}=240 \mathrm{~kJ} / \mathrm{mole}$.

## PROCEDURE:

1. Record the concentration of the standardized HCl provided in the laboratory. Obtain about 40 mL of this HCl solution and place it in a 25 mL buret.
2. A solution of calcium hydroxide will be stirring at room temperature in the laboratory. Draw off approximately 40 mL of this solution and record the temperature. Filter the solution using a long stem funnel until you have at least 30 mL of filtrate (if the filtering is slow, consider starting step 3 below.) Place 10.0 mL of the filtrate into a clean 125 mL Erlenmeyer flask and add 25 mL of distilled water and a few drops of bromothymol blue indicator. Titrate with the standard HCl solution until the yellow endpoint appears (probably no more than 5 mL of HCl will be required to reach the endpoint). Record the volume of HCl used to 0.01 mL . Repeat this procedure two more times.
3. Prepare a $100{ }^{\circ} \mathrm{C}$ saturated calcium hydroxide solution by bringing 100 mL of distilled water to a boil in a 250 mL beaker. After the water has been boiling for several minutes, add about 2 g of $\mathrm{Ca}(\mathrm{OH})_{2}$ to the water and keep it near boiling with occasional stirring until needed.
4. Bring your hot solution to a gentle boil for about two minutes, turn off the burner, measure the temperature and quickly draw off about $40-50 \mathrm{~mL}$ of solution. Quickly filter the solution using a clean, dry long stem funnel.
5. Place 10.0 mL of the cooled filtrate into each of three clean 125 mL Erlenmeyer flasks and add 25 mL of distilled water and a few drops of bromothymol blue indicator. When the solution is cool, titrate with the standard HCl solution until the yellow endpoint appears (probably no more than 5 mL of HCl will be required to reach the endpoint). Record the volume of HCl used to 0.01 mL . Repeat two more times.
6. Dispose of all used and excess chemicals in a waste container. Rinse your buret and all glassware with water before returning to its original location.

CALCULATIONS: Be sure to look at the example on the previous page for hints on how to get started!

1. Find the average solubility (and parts per thousand) of calcium hydroxide at each temperature by finding the hydroxide ion concentration and then converting this value to the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$. If one of the three equivalence point volumes differs from the other two, it is acceptable to omit the differing value and use the two values with close precision.
2. Find $\mathbf{K}_{\text {sp }}$ at each temperature using the average solubility value. Find $\Delta \mathbf{G}^{\circ}$ at each temperature using the two values of $K_{\text {sp }}$.
3. Find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ using the values of $\mathrm{K}_{\mathrm{sp}}$ and $\Delta \mathrm{G}^{\circ}$ at the two temperatures.

# Determination of $\boldsymbol{K}_{\mathrm{sp}}, \Delta \mathbf{G}^{\circ}, \Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for $\mathrm{Ca}(\mathbf{O H})_{2} \mathbf{L a b}$ 

## Your name:

Purpose: The goal of this lab is to find $K_{\mathrm{sp}}, \Delta \mathrm{G}^{\circ}, \Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for $\mathrm{Ca}(\mathrm{OH})_{2}$.

Goal \#1: Watch the following video related to this lab: http://mhchem.org/v/k.htm

Write down the following data from the video which relates to this lab:

## Concentration of $\mathrm{HCl}(\mathrm{M})$ :

$\qquad$

Temperature for first set of data $=$ $\qquad$ ${ }^{\circ} \mathrm{C}$ Lower temperature

Temperature for second set of data $=$ $\qquad$ ${ }^{\circ} \mathrm{C}$ Higher Temperature
mL HCl at lower Temperature $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Notes: (optional)

Goal \#2: Determine the solubility of $\mathbf{C a}(\mathbf{O H})_{2}$ at two different temperatures. We will do two simultaneous calculations in order to find the solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ at each temperature. We can use the mL of HCl titrated and the molarity to find moles of HCl , and this equals moles of hydroxide (1:1 ratio). There are two hydroxides per one $\mathrm{Ca}(\mathrm{OH})_{2}$, so we will apply this stoichiometry to find the moles of $\mathrm{Ca}(\mathrm{OH})_{2}$ in the original mixture. Dividing by the liters of $\mathrm{Ca}(\mathrm{OH})_{2}$ used ( 0.0100 L in this lab) will give us the solubility. This calculation scheme will be applied to both temperature sets in order to find the solubility at each temperature.

## Convert $\mathbf{m L}$ of HCl into moles of $\left[\mathrm{OH}^{-1}\right]$ at each temperature:

Convert mL to $L$ of HCl
Multiply $L$ of HCl by $\left(\mathrm{HCl}\right.$ molarity) ${ }^{*}\left(1 \mathrm{~mol} \mathrm{OH}^{-1} / 1 \mathrm{~mol} \mathrm{HCl}\right)=$ this equals moles $\mathrm{OH}^{-1}$ moles $\mathrm{OH}^{-1 *}\left(1 \mathrm{~mol} \mathrm{Ca}(\mathrm{OH})_{2} / 2\right.$ moles $\left.\mathrm{OH}^{-1}\right) / 0.0100 \mathrm{~L}=$ solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ (in M$)$

Concentration HCl (M): $\qquad$ from Goal \#1

At lower temperature:

Temperature $=$ $\qquad$ ${ }^{\circ}$ C from Goal \#1
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M

## Average of three lower temperature solubilities =

$\qquad$

## Parts per thousand $=$

$\qquad$

Info on parts per thousand: https://mhchem.org/ppt

Show examples of how this work was accomplished

## Goal \#2: (continued)

At higher temperature:

Temperature $=$ $\qquad$ ${ }^{\circ}$ C from Goal \#1
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M
$\qquad$ mL HCl equates to a solubility of $\qquad$ M

Average of three higher temperature solubilities $=$ $\qquad$

Parts per thousand $=$ $\qquad$
Info on parts per thousand: https://mhchem.org/ppt

Show examples of how this work was accomplished

Goal \#3: Find the value of $K_{\text {sp }}$ and $\Delta \mathbf{G}^{\circ}$ at each temperature. We can use $K_{\text {sp }}=4(\text { solubility })^{3}$ to convert each average solubility into a $K_{\text {sp }}$ value. Using $K_{\text {sp }}$, we can convert each value into a $\Delta G^{\circ}$ using the relation $\Delta G^{\circ}=-R T \ln K_{\mathrm{sp}}$ where $\boldsymbol{R}=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$ and $\boldsymbol{T}=$ Kelvin temperature

At lower temperature:
Lower temperature $\left({ }^{\circ} \mathrm{C}\right)=$ $\qquad$ from Goal \#1

Lower temperature $(\mathrm{K})=$ $\qquad$

Average of three lower temperature solubilities $=$ $\qquad$ from Goal \#2
$\boldsymbol{K}_{\text {sp }}=4(\text { solubility })^{3}=$ $\qquad$ where solubility $=$ average lower temp. solubility
$\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{K}_{\mathrm{sp}}=$ $\qquad$ ( $\mathrm{kJ} / \mathrm{mol}$ )
Use $R=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$, $T=$ Kelvin temp., Ksp = answer on previous line Convert J to $k J$ to get the final answer

Show examples of how this work was accomplished

## Goal \#3: Continued

At higher temperature:
Higher temperature $\left({ }^{\circ} \mathrm{C}\right)=$ $\qquad$ from Goal \#1

Higher temperature $(\mathrm{K})=$ $\qquad$

Average of three higher temperature solubilities $=$ $\qquad$ from Goal \#2
$\boldsymbol{K}_{\text {sp }}=4(\text { solubility })^{3}=$ $\qquad$ where solubility $=$ average high temp. solubility

$$
\Delta \mathbf{G}^{\circ}=-\mathrm{RT} \ln \mathrm{~K}_{\mathrm{sp}}=
$$

Use $R=8.3145 \mathrm{~J} / \mathrm{mol}^{*} K$, $T=$ Kelvin temp., Ksp = answer on previous line Convert J to $k J$ to get the final answer

Show examples of how this work was accomplished

Goal \#4: Use the values of $\Delta \mathbf{G}^{\circ}$ and $\mathbf{T}$ to find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$. We will use the $\Delta G^{\circ}$ and Kelvin temperatures to find $\Delta H^{\circ}$ and $\Delta S^{\circ}$ using the Gibbs Equation, $\Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ}$ From Goal \#3:

Lower temperature $(\mathrm{K})=$ $\qquad$

$$
\Delta \mathrm{G}^{\circ}=\ldots(\mathrm{kJ} / \mathrm{mol})
$$

Higher temperature $(\mathrm{K})=$ $\qquad$

$$
\Delta \mathrm{G}^{\circ}=\ldots(\mathrm{kJ} / \mathrm{mol})
$$

Find $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ in the space below. Follow the video for an example of how this can be done. Clearly show your work for full credit.
$\Delta \mathrm{H}^{\circ}=$ $\qquad$ (kJ/mol)

$$
\Delta \mathrm{S}^{\circ}=
$$

$\qquad$ (kJ/mol)

## Postlab Questions:

1. A 10.00 mL sample of $\mathrm{Ba}(\mathrm{OH})_{2}$ at $0 .{ }^{\circ} \mathrm{C}$ is titrated with 0.2500 M HCl , and 4.80 mL of the acid are used to reach the yellow endpoint.
a. Calculate the concentration of hydroxide in the $\mathrm{Ba}(\mathrm{OH})_{2}$ solution.
b. Determine the molar solubility and $K_{\text {sp }}$ of $\mathrm{Ba}(\mathrm{OH})_{2}$.
c. Calculate $\Delta \mathrm{G}^{\circ}$ for this reaction using the value of $K_{\text {sp }}$.
2. A second 10.00 mL sample of $\mathrm{Ba}(\mathrm{OH})_{2}$ is obtained at a temperature of $50 .{ }^{\circ} \mathrm{C}$. This solution is titrated with 44.15 mL of 0.2500 M HCl to reach the yellow endpoint.
a. Calculate the concentration of hydroxide in this $\mathrm{Ba}(\mathrm{OH})_{2}$ solution.
b. Determine the molar solubility and $K_{\text {sp }}$.
c. Calculate $\Delta \mathrm{G}^{\circ}$ for this reaction using the value of $K_{\text {sp }}$.
3. Using the values of $\Delta \mathrm{G}^{\circ}$ at $0 .{ }^{\circ} \mathrm{C}$ and $50 .{ }^{\circ} \mathrm{C}$, calculate $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for this reaction.

## Postlab Questions: Continued

4. Look up and report the value of $\mathrm{K}_{\text {sp }}$ for calcium hydroxide at $25^{\circ} \mathrm{C}$ in your textbook or on the internet. How does your room temperature ("lower temperature") value compare to the reference? What are the sources of error? Cite your reference for the $\mathrm{K}_{\text {sp }}$ value.
5. Calculate the molar solubility of $\mathrm{Ca}(\mathrm{OH})_{2}$ at $50^{\circ} \mathrm{C}$ using your experimental values of $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$. (Hint: First find $\Delta \mathrm{G}^{\circ}$ at the new temperature, then determine Ksp and finally solubility.) Is this solubility the average of the $0{ }^{\circ} \mathrm{C}$ and $100{ }^{\circ} \mathrm{C}$ solubilities? Why or why not? (Hint: are the equations used to determine solubility linear?)

# CH 223 Spring 2024: <br> "Exam Prep Calculations" (online) Lab: Instructions 

Note: This is the lab for section W1 of CH 223 only.

- If you are taking section 01 or Hl of CH 223 , please use this link: http://mhchem.org/q/8a.htm

## Step One:

There is no lab video for this lab. This lab will give you a series of multiple choice questions to answer which will help you on the final lecture exam. The concepts in these questions will range from Chemistry 221 through Chemistry 222 and Chemistry 223.

Step Two:
Submit your lab (page Ib-8-8 plus the work pages only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, May 29 by 11:59 PM. I recommend a free program (ex: CamScanner, https:// camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## Exam Prep Calculations

Directions: Provide your final answers to these questions on the last page of the handout. Good luck!

1. How many oxygen atoms are in 225 g O 2 ?
(A) $4.23 \times 10^{23}$
(B) $6.84 \times 10^{24}$
(C) $8.47 \times 10^{24}$
(D) $1.69 \times 10^{25}$
2. A 0.300 M solution of HCl is prepared by adding some 1.50 M HCl to a 750 mL volumetric flask and diluting to the mark with deionized water. What volume of 1.50 M HCl must be added?
(A) $100 . \mathrm{mL}$
(B) $150 . \mathrm{mL}$
(C) $225 . \mathrm{mL}$
(D) $250 . \mathrm{mL}$
3. Copper(I) oxide, $\mathrm{Cu}_{2} \mathrm{O}$, is reduced to metallic copper by heating in a stream of hydrogen gas. What mass of water is produced when 10.00 g copper is formed?
(A) 1.259 g
(B) 1.417 g
(C) 2.835 g
(D) 5.670 g
4. The mineral enargite is $48.41 \% \mathrm{Cu}, 19.02 \% \mathrm{As}$, and $32.57 \% \mathrm{~S}$ by mass. What is the empirical formula of enargite?
(A) CuAsS
(B) $\mathrm{Cu}_{2} \mathrm{AsS}_{2}$
(C) Cu 3 AsS 4
(D) Cu 4 AsS 3
5. A solution contains $0.1 \mathrm{M} \mathrm{Ca}^{2+}$ ions and $0.1 \mathrm{M} \mathrm{Pb}^{2+}$ ions. Addition of an equal volume of a 0.5 M solution of which reagent will cause precipitation of a calcium salt but not a lead salt?
(A) $\mathrm{NaNO}_{3}$
(B) NaF
(C) NaOH
(D) NaCl
6. Consider the four gases $\mathrm{CO}_{2}, \mathrm{~N} 2, \mathrm{CCl}_{4}$, and He . Which is the correct order of increasing average molecular speed at $100^{\circ} \mathrm{C}$ ?
(A) $\mathrm{He}<\mathrm{N}_{2}<\mathrm{CO}_{2}<\mathrm{CCl}_{4}$
(B) $\mathrm{CCl}_{4}<\mathrm{CO}_{2}<\mathrm{N}_{2}<\mathrm{He}$
(C) $\mathrm{He}<\mathrm{CO}_{2}<\mathrm{N}_{2}<\mathrm{CCl}_{4}$
(D) $\mathrm{CCl}_{4}<\mathrm{N}_{2}<\mathrm{CO}_{2}<\mathrm{He}$
7. In the guanidinium ion, $\left[\mathrm{C}\left(\mathrm{NH}_{2}\right)_{3}\right]^{+}$, what is the best description of the hybridizations of the nitrogen atoms?
(A) All three $\mathrm{sp}^{3}$
(B) Two $\mathrm{sp}^{3}$, one $\mathrm{sp}^{2}$
(C) One $\mathrm{sp}^{3}$, two $\mathrm{sp}^{2}$
(D) All three $\mathrm{sp}^{2}$
8. To 100.0 g water at $25.00^{\circ} \mathrm{C}$ in a well-insulated container is added a block of aluminum initially at $100.0^{\circ} \mathrm{C}$. The temperature of the water once the system reaches thermal equilibrium is $28.00^{\circ} \mathrm{C}$. What is the mass of the aluminum block? (The specific heat capacity of Al is $0.900 \mathrm{~J} \mathrm{~g}^{-1} \mathrm{~K}^{-1}$.)
(A) 4.17 g
(B) 18.6 g
(C) 19.4 g
(D) $130 . \mathrm{g}$
9. The standard enthalpy of formation, $\Delta H_{\mathrm{f}}$, of the compound $\mathrm{MgO}(\mathrm{s})$ is equal to the standard enthalpy change for which reaction?
(A) $\mathrm{Mg}(\mathrm{s})+1 / 2 \mathrm{O} 2(\mathrm{~g}) \rightarrow \mathrm{MgO}(\mathrm{s})$
(B) $2 \mathrm{Mg}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{MgO}(\mathrm{s})$
(C) $\mathrm{Mg}(\mathrm{g})+\mathrm{O}(\mathrm{g}) \rightarrow \mathrm{MgO}(\mathrm{s})$
(D) $\mathrm{Mg}^{2+}(\mathrm{aq})+\mathrm{O}^{2-}(\mathrm{aq}) \rightarrow \mathrm{MgO}(\mathrm{s})$
10. What is the standard Gibbs free energy of formation, $\Delta \mathrm{G}^{\mathrm{o}}$, of $\mathrm{NH} 3(\mathrm{~g})$ at 298 K ?

| Substance | $\Delta H^{\mathrm{o}} \mathrm{f}, \mathrm{kJ} \mathrm{mol}^{-1}$ | $S^{\mathrm{o}, \mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}}$ |
| :---: | :---: | :---: |
| $\mathrm{H}_{2}(\mathrm{~g})$ | 0 | 131 |
| $\mathrm{~N}_{2}(g)$ | 0 | 192 |
| $\mathrm{NH}_{3}(g)$ | -46 | 193 |

(A) $-104 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(B) $-16 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(C) $-7 \mathrm{~kJ} \mathrm{~mol}^{-1}$
(D) $13 \mathrm{~kJ} \mathrm{~mol}^{-1}$
11. Which of the following reactions takes place with an increase in entropy under standard conditions?
(A) $\mathrm{K}_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightarrow \mathrm{K}_{2} \mathrm{O}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
(B) $\mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})$
(C) $\mathrm{NH}_{3}(\mathrm{~g})+\mathrm{HCl}(\mathrm{g}) \rightarrow \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$
(D) $\mathrm{C}_{2} \mathrm{H} 4(\mathrm{~g})+\mathrm{Br}_{2}(\mathrm{l}) \rightarrow \mathrm{C}_{2} \mathrm{H}_{4} \mathrm{Br}_{2}(\mathrm{l})$
12. Iodine- 131 decays with a half-life of 8.02 d . In a sample initially containing 5.00 mg of ${ }^{131} \mathrm{I}$, what mass remains after 17.2 d ?
(A) 1.13 mg
(B) 1.87 mg
(C) 2.97 mg
(D) 3.13 mg
13. For an irreversible reaction $\mathrm{A} \rightarrow$ products, the graph of $1 /[\mathrm{A}]$ as a function of time is linear. What is the reaction order in A ?
(A) Zero order
(B) First order
(C) Second order
(D) The order in A cannot be determined based on the information given.
14. In comparing two reactions, the reaction with the greater activation energy always has
(A) the slower rate.
(B) the faster rate.
(C) the rate that varies less with temperature.
(D) the rate that varies more with temperature.
15. The formation of NOBr :

$$
2 \mathrm{NO}(\mathrm{~g})+\mathrm{Br} 2(\mathrm{~g}) \rightarrow 2 \mathrm{NOBr}(\mathrm{~g}),
$$

is studied, and the following mechanism is proposed: In this reaction, $\mathrm{NOBr}_{2}(\mathrm{~g})$ is best described as:

$$
\begin{array}{ll}
\mathrm{NO}(\mathrm{~g})+\operatorname{Br} 2(\mathrm{~g}) \leftrightarrows \mathrm{NOBr}_{2}(\mathrm{~g}) & \text { fast, equilibrium } \\
\mathrm{NO}(\mathrm{~g})+\mathrm{NOBr}_{2}(\mathrm{~g}) \rightarrow 2 \operatorname{NOBr}(\mathrm{~g}) & \text { slow }
\end{array}
$$

In this reaction, $\mathrm{NOBr}_{2}(\mathrm{~g})$ is best described as:
(A) an intermediate.
(B) a product
(C) a homogeneous catalyst.
(D) a heterogeneous catalyst.
16. What mass of silver chloride $\left(\mathrm{MM}=143.4 \mathrm{~g} \mathrm{~mol}^{-1}\right)$ will dissolve in 1.00 L of water? The $\mathrm{K}_{\mathrm{sp}}$ of AgCl is $1.8 \times 10^{-10}$.
(A) 1.4 mg
(B) 1.9 mg
(C) 2.9 mg
(D) 3.8 mg
17. What is the pH of a 0.98 M solution of sodium benzoate, $\mathrm{NaC}_{6} \mathrm{H}_{5} \mathrm{COO}$ ? The $\mathrm{K}_{\mathrm{a}}$ of benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$, is $6.5 \times 10^{-5}$.
(A) 5.26
(B) 8.74
(C) 9.09
(D) 11.56

18 Sulfur trioxide is formed from the reaction of sulfur dioxide and oxygen:

$$
\mathrm{SO}_{2}(\mathrm{~g})+1 / 2 \mathrm{O} 2(\mathrm{~g}) \rightleftharpoons \mathrm{SO} 3(\mathrm{~g})
$$

At 1000 K , an equilibrium mixture has partial pressures of $0.562 \mathrm{~atm} \mathrm{SO}_{2}, 0.101 \mathrm{~atm} \mathrm{O}_{2}$, and 0.332 atm SO 3 . What is the equilibrium constant Kp for the reaction at this temperature?
(A) 1.86
(B) 3.46
(C) 5.85
(D) 16.8
19. The following exothermic reaction is at equilibrium in a sealed container:

$$
\mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow \mathrm{PCl}_{5}(\mathrm{~g})
$$

Which of the following changes would result in an increase in the number of moles of $\mathrm{PCl}_{3}(\mathrm{~g})$ present at equilibrium?
I. Increasing the temperature
II. Increasing the volume
(A) I only
(B) II only
(C) Both I and II
(D) Neither I nor II
20. Which gas-phase molecule is linear?
(A) $\mathrm{COS}_{2}$
(B) $\mathrm{SO}_{2}$
(C) HCCH
(D) $\mathrm{Br}_{2} \mathrm{CCBr}_{2}$

## Exam Prep Calculations - Worksheet

## YOUR NAME:

$\qquad$

Enter your answer next to the question number. There is only one best answer for each question. To the back of this form include all work necessary to complete each question.

# CH 223 Spring 2024: "Special Lab": Instructions 

Note: This is the lab is for section W1 of CH 223 only.

- If you are taking section 01 or H 1 of CH 223 , please use this link:
http://mhchem.org/q/9a.htm

Step One:
There is no lab video for this lab. :)
Step Two:
Submit your lab (pages Ib-9-2 through Ib-9-5 only to avoid a point penalty) as a single PDF file to the instructor via email (mike.russell@mhcc.edu) on Wednesday, June 5 by 11:59 PM. I recommend a free program (ex: CamScanner, https://camscanner.com) or a website (ex: CombinePDF, https://combinepdf.com) to convert your work to a PDF file.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## The Crossword Puzzle Hints:

## Across

7. Protons and neutrons in the atom
8. Positive subatomic particle
9. Paper used to measure pH
10. Solute plus solvent equals a $\qquad$
11. Produces OH - ions in solution
12. Eye protection
13. A test in the laboratory
14. An atom or molecule with an electric charge
15. Metric prefix $10^{-6}$
16. Cylindrical glass container
17. K
18. Heavy hydrogen
19. Measures the pressure
20. $6.022 \times 10^{23}$
21. A substance which cannot be broken down by chemical means
22. A nucleus orbited by electrons

## Down

1. Bunsen $\qquad$
2. Negatively charged particle
3. Positively charged particle
4. Negative subatomic particle
5. Same element but different number of neutrons
6. Metric prefix $10^{-2}$
7. Na
8. Might be calibrated in Fahrenheit or Celsius
9. Used to measure mass
10. Cu
11. Metric prefix $10^{-3}$
12. Metric prefix $10^{3}$
13. Neutral subatomic particle
14. Produces $\mathrm{H}+$ ions in solution
15. Combination of two or more atoms
16. Metric prefix $10^{-9}$

The words can be vertically, horizontally or diagonally placed. They can be backwards or forwards. Good luck!

## Poetry:

Find a poem about chemistry on the internet, or better yet, make one of your own! Include the poem here, on this page. If you find a poem from the internet, please list the source (URL).

## This page left blank for printing purposes

# CH 223 Spring 2024: Problem Set \#1 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#1 by reading Chapter 13 of the textbook and/ or by watching the videos found on our website (https://mhchem.org/223)
- Try the problems for Problem Set \#1 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
Section 01 and H1: We will go over Problem Set \#1 during recitation. Self correct all problems of your problem set before turning it in at the end of recitation.

- Section 01: due Monday, April 8 at 1:10 PM
- Section H1: due Wednesday, April 10 at 1:10 PM

Section W1: Watch the recitation video for Problem Set \#1:
http://mhchem.org/v/m.htm

- Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.)
- Submit Problem Set \#1 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, April 10.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#1

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

Covering: Chapter Thirteen and Chapter Guide One
Important Tables and/or Constants: $\mathbf{R}=\mathbf{0 . 0 8 2 0 5 7} \mathrm{L} \mathrm{atm} \mathrm{mol}^{\mathbf{- 1}} \mathrm{K}^{\mathbf{- 1}}, \mathbf{7 6 0} \mathbf{~ m m ~ H g}=\mathbf{1} \mathbf{~ a t m}$

1. Write equilibrium constant expressions for the following reactions. For gases use either pressures or concentrations.
a. $3 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{O}_{3}(\mathrm{~g})$
b. $\mathrm{Fe}(\mathrm{s})+5 \mathrm{CO}(\mathrm{g}) \rightleftharpoons \mathrm{Fe}(\mathrm{CO})_{5}(\mathrm{~g})$
c. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
d. $\mathrm{Ag}_{2} \mathrm{SO}_{4}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
2. The equilibrium constant, $K$, for the reaction:

$$
2 \mathrm{NOCl}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

is $3.9 \times 10^{-3}$ at $300{ }^{\circ} \mathrm{C}$. A mixture contains the gases at the following concentrations: [ NOCl ] $=5.0 \times 10^{-3} \mathrm{M},[\mathrm{NO}]=2.5 \times 10^{-3} \mathrm{M}$, and $\left[\mathrm{Cl}_{2}\right]=2.0 \times 10^{-3} \mathrm{M}$. Is the reaction at equilibrium at $300{ }^{\circ} \mathrm{C}$ ? If not, in which direction does the reaction proceed to come to equilibrium?
3. An equilibrium mixture of $\mathrm{SO}_{2}, \mathrm{O}_{2}$ and $\mathrm{SO}_{3}$ at 1000 K contains the gases at the following concentrations: $\left[\mathrm{SO}_{2}\right]=3.77 \times 10^{-3} \mathrm{M},\left[\mathrm{O}_{2}\right]=4.30 \times 10^{-3} \mathrm{M}$, and $\left[\mathrm{SO}_{3}\right]=4.13 \times 10^{-3} \mathrm{M}$. Calculate the equilibrium constant, $K_{c}$, for the reaction:

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g})
$$

4. You place 3.00 mol of pure $\mathrm{SO}_{3}$ in an 8.00 L flask at 1150 K . At equilibrium, 0.58 mol of $\mathrm{O}_{2}$ has formed. Calculate $K_{c}$ for the reaction at 1150 K using the reaction:

$$
2 \mathrm{SO}_{3}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})
$$

5. Cyclohexane, $\mathrm{C}_{6} \mathrm{H}_{12}$, a hydrocarbon, can isomerize or change into methylcyclopentane, $\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{CH}_{3}$, a compound of the same formula but with a different molecular structure. The equilibrium constant has been estimated to be 0.12 at $25^{\circ} \mathrm{C}$. If you originally placed 0.045 mol of cyclohexane in a 2.8 L flask, what would be the concentrations of cyclohexane and methylcyclopentane when equilibrium is established? Use the equation:

$$
\mathrm{C}_{6} \mathrm{H}_{12}(\mathrm{~g}) \rightleftharpoons \mathrm{C}_{5} \mathrm{H}_{9} \mathrm{CH}_{3}(\mathrm{~g})
$$

6. $K_{\mathrm{p}}$ for the following reaction is 0.16 at $25^{\circ} \mathrm{C}$ :
$2 \operatorname{NOBr}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{g})+\mathrm{Br}_{2}(\mathrm{~g})$
The enthalpy change for the reaction at standard conditions is +16.3 kJ . Predict the effect of the following changes on the position of the equilibrium; that is, state which way the equilibrium will shift (left, right, or no change) when each of the following changes is made.
a. adding more $\mathrm{Br}_{2}(\mathrm{~g})$
b. removing some $\mathrm{NOBr}(\mathrm{g})$
c. decreasing the temperature
d. increasing the container volume

## Problem Set \#1 continues on the next page

7. The decomposition of $\mathrm{NH}_{4} \mathrm{HS}$ is an endothermic process:
$\mathrm{NH}_{4} \mathrm{HS}(\mathrm{s}) \rightleftharpoons \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$
a. Using Le Chatelier's principle, how would increasing the temperature affect the equilibrium?
b. How would K be affected if additional $\mathrm{NH}_{3}$ is placed in the flask?
c. What will happen to the pressure of $\mathrm{NH}_{3}$ if some $\mathrm{H}_{2} \mathrm{~S}$ is removed from the flask?
8. The equilibrium constant for the reaction

$$
\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{~g})
$$

is $1.7 \times 10^{-3}$ at 2300 K .
a. What is $K$ for the reaction when written as follows:

$$
1 / 2 \mathrm{~N}_{2}(\mathrm{~g})+1 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{NO}(\mathrm{~g})
$$

b. What is $K$ for the following reaction?

$$
2 \mathrm{NO}(\mathrm{~g}) \rightleftharpoons \mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})
$$

9. The equilibrium constant $K$ for the reaction

$$
\mathrm{CO}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}(\mathrm{~g})+1 / 2 \mathrm{O}_{2}(\mathrm{~g})
$$

is $6.66 \times 10^{-12}$ at 1000 K . Calculate $K$ for the reaction

$$
2 \mathrm{CO}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{CO}_{2}(\mathrm{~g})
$$

10. Ammonium iodide dissociates reversibly to ammonia and hydrogen iodide if the salt is heated to a sufficiently high temperature. Some ammonium iodide is placed in a flask, which is then heated to $400{ }^{\circ} \mathrm{C}$. If the total pressure in the flask when equilibrium has been achieved is 705 mm Hg , what is the value of $K_{\mathrm{p}}$ (when partial pressures are in atmospheres)?

$$
\mathrm{NH}_{4} \mathrm{I}(\mathrm{~s}) \rightleftharpoons \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{HI}(\mathrm{~g})
$$

11. In the gas phase, acetic acid exists as an equilibrium of monomer and dimer molecules. The dimer consists of two molecules of acetic acid linked through hydrogen bonds. The equilibrium constant, $K$, for the monomer-dimer equilibrium shown below has been determined to be $3.2 \times 10^{4}$. Assume that acetic acid is present initially at a concentration of $5.4 \times 10^{-4} \mathrm{M}$ at $25^{\circ} \mathrm{C}$ and that no dimer is present initially.

$$
2 \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{~g}) \rightleftharpoons\left(\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right)_{2}(\mathrm{~g})
$$

a. What percentage of the acetic acid is converted to the dimer?
b. As the temperature increases, in which direction does the equilibrium shift? (Recall that hydrogen bond formation is an exothermic process.)
12. At $450{ }^{\circ} \mathrm{C}, 3.60 \mathrm{~mol}$ of ammonia is placed in a 2.00 L flask and allowed to decompose into the elements. If the experimental value of $K_{c}$ is 6.3 for this reaction at this temperature, calculate the equilibrium concentration of each reagent. What is the total pressure in the flask? The reaction:

$$
2 \mathrm{NH}_{3}(\mathrm{~g}) \rightleftharpoons \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})
$$

## Problem Set \#1 continues on the next page

13. $K_{\mathrm{c}}$ for the decomposition of ammonium hydrogen sulfide is $1.8 \times 10^{-4}$ at $25^{\circ} \mathrm{C}$. The reaction:

$$
\mathrm{NH}_{4} \mathrm{HS}(\mathrm{~s}) \rightleftharpoons \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})
$$

a. When the pure salt decomposes in a flask, what are the equilibrium concentrations of $\mathrm{NH}_{3}$ and $\mathrm{H}_{2} \mathrm{~S}$ ?
b. If $\mathrm{NH}_{4} \mathrm{HS}$ is placed in a flask already containing $0.020 \mathrm{M}^{\text {of } \mathrm{NH}_{3} \text { and then the system }}$ is allowed to come to equilibrium, what are the equilibrium concentrations of $\mathrm{NH}_{3}$ and $\mathrm{H}_{2} \mathrm{~S}$ ?
14. The dissociation of calcium carbonate has an equilibrium constant $K_{\mathrm{p}}=1.16$ at $800 .{ }^{\circ} \mathrm{C}$.

$$
\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftarrows \mathrm{CaO}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

a. What is $K_{\mathrm{c}}$ for the reaction?
b. If you place 22.5 g of $\mathrm{CaCO}_{3}$ in a 9.56 L container at $800 .{ }^{\circ} \mathrm{C}$, what is the pressure of $\mathrm{CO}_{2}$ in the container?
c. What percentage of the original 22.5 g sample of $\mathrm{CaCO}_{3}$ remains undecomposed at equilibrium?

# CH 223 Spring 2024: Problem Set \#2 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#2 by reading Chapter 14 (up to 14.5) and Chapter 15 (15.2) of the textbook and/or by watching the videos found on our website (https://mhchem.org/223)
- Try the problems for Problem Set \#2 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
Section 01 and H1: We will go over Problem Set \#2 during recitation. Self correct all problems of your problem set before turning it in at the end of recitation.

- Section 01: due Monday, April 15 at 1:10 PM
- Section H1: due Wednesday, April 17 at 1:10 PM

Section W1: Watch the recitation video for Problem Set \#2:

## http://mhchem.org/v/n.htm

- Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.)
- Submit Problem Set \#2 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, April 17.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#2

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

Covering: Chapter Fourteen Part I and Chapter Guide Two
Important Tables and/or Constants: The Table of Acids and Bases for CH 223 which follows this problem set, and $K_{w}=1.00 \times 10^{-14}$ at $25^{\circ} \mathrm{C}$

1. In each of the following acid-base reactions, identify the Brønsted acid and base on the left and their conjugate partners on the right.
a. $\mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{HCO}_{2}^{-1}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$
b. $\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{HS}^{-1}(\mathrm{aq})$
c. $\mathrm{HSO}_{4}^{-1}(\mathrm{aq})+\mathrm{OH}^{-1}(\mathrm{aq}) \rightleftharpoons \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)$
2. What are the products of each of the following acid-base reactions? Indicate the acid and its conjugate base, and the base and its conjugate acid.
a. $\mathrm{HClO}_{4}+\mathrm{H}_{2} \mathrm{O} \rightarrow$
b. $\mathrm{NH}_{4}++\mathrm{H}_{2} \mathrm{O} \rightarrow$
3. Write balanced equations showing how the $\mathrm{HPO}_{4}{ }^{2-}$ ion of sodium hydrogen phosphate, $\mathrm{Na}_{2} \mathrm{HPO}_{4}$, can be a Brønsted acid or a Brønsted base.
4. Several acids are listed here with their respective equilibrium constants:

$$
\begin{gathered}
\mathrm{HF}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{F}^{-1}(\mathrm{aq}) \\
K_{\mathrm{a}}=7.2 \times 10^{-4} \\
\mathrm{HPO}_{4}-2(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{PO}_{4}^{-3}(\mathrm{aq}) \\
K_{\mathrm{a}}=3.6 \times 10^{-13} \\
\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2}^{-1}(\mathrm{aq}) \\
K_{\mathrm{a}}=1.8 \times 10^{-5}
\end{gathered}
$$

a. Which is the strongest acid? Which is the weakest acid?
b. What is the conjugate base of the acid HF?
c. Which acid has the weakest conjugate base?
d. Which acid has the strongest conjugate base?
5. For each of the following reactions, predict whether the equilibrium lies predominantly to the left or to the right. Explain your prediction briefly. Use a table of acids and bases to answer this question.
a. $\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})+\mathrm{CO}_{3^{2-}}(\mathrm{aq}) \rightleftharpoons \mathrm{HS}^{-1}(\mathrm{aq})+\mathrm{HCO}_{3}^{-1}(\mathrm{aq})$
b. $\mathrm{HCN}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq}) \rightleftharpoons \mathrm{CN}^{-1}(\mathrm{aq})+\mathrm{HSO}_{4}^{-1}(\mathrm{aq})$
c. $\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq}) \rightleftharpoons \mathrm{HSO}_{4}{ }^{-1}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-1}(\mathrm{aq})$
6. A saturated solution of milk of magnesia, $\mathrm{Mg}(\mathrm{OH})_{2}$, has a pH of 10.52 . What is the hydronium ion concentration of the solution? What is the hydroxide ion concentration? Is the solution acidic or basic?

Problem Set \#2 continues on the next page
7. The pH of a solution of $\mathrm{Ba}(\mathrm{OH})_{2}$ is 10.66 at $25^{\circ} \mathrm{C}$. What is the hydroxide ion concentration in the solution? If the solution volume is 125 mL , how many grams of $\mathrm{Ba}(\mathrm{OH})_{2}$ must have been dissolved?
8. An organic acid has $\mathrm{p} K_{\mathrm{a}}=8.95$. What is its $K_{\mathrm{a}}$ value?
9. A weak base has $K_{\mathrm{b}}=1.5 \times 10^{-9}$. What is the value of $K_{\mathrm{a}}$ for the conjugate acid?
10. The ionization constant of a very weak acid, HA, is $4.0 \times 10^{-9}$. Calculate the equilibrium concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{A}^{-1}$ and HA in a 0.040 M solution of the acid.
11. The weak base methylamine, $\mathrm{CH}_{3} \mathrm{NH}_{2}$, has $K_{\mathrm{b}}=4.2 \times 10^{-4}$. Calculate the equilibrium hydroxide ion concentration in a 0.25 M solution of the base. What are the pH and pOH of the solution?
12. Calculate the hydronium ion concentration and pH for a 0.015 M solution of sodium formate, $\mathrm{NaHCO}_{2}$. Use a table of acids and bases to answer this question.
13. Decide whether each of the following substances should be classified as a Lewis acid or a Lewis base.
a. $\mathrm{BCl}_{3}$ (Hint: draw the electron dot structure)
b. $\mathrm{H}_{2} \mathrm{NNH}_{2}$, hydrazine (Hint: draw the electron dot structure)
c. The reactants in the reaction:

$$
\mathrm{Fe}(\mathrm{~s})+5 \mathrm{CO}(\mathrm{~g}) \rightleftharpoons \mathrm{Fe}(\mathrm{CO})_{5}(\mathrm{~g})
$$

Table of Acids and Bases for CH 223

[^2]
# CH 223 Spring 2024: Problem Set \#3 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#3 by reading Chapter 14 of the textbook and/or by watching the videos found on our website (https://mhchem.org/223)
- Try the problems for Problem Set \#3 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
Section 01 and H1: We will go over Problem Set \#3 during recitation. Self correct all problems of your problem set before turning it in at the end of recitation.

- Section 01: due Monday, April 22 at 1:10 PM
- Section H1: due Wednesday, April 24 at 1:10 PM

Section W1: Watch the recitation video for Problem Set \#3:
http://mhchem.org/v/p.htm

- Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.)
- Submit Problem Set \#3 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, April 24.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#3

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

## Covering: Chapter Fourteen Part II and Chapter Guide Three

Important Tables and/or Constants: "Titration Guide" (Handout), "Buffers and Henderson-Hasselbalch
Guide" (Handout) and the Table of Acids and Bases for CH 223 (after this problem set), $\mathbf{K}_{\mathbf{w}}=\mathbf{1 . 0 0} \mathbf{x 1 0 - 1 4}$ at $25^{\circ} \mathrm{C}$

1. Calculate the hydronium ion concentration and the pH when 50.0 mL of $0.40 \mathrm{M} \mathrm{NH}_{3}$ is mixed with 50.0 mL of 0.40 M HCl . Use a table to look up relevant $K$ values. Hint: Determine the region this problem would use from the WB + SA Titration Calculations lab.
2. What is the pH of the solution that results from adding 25.0 mL of 0.12 M HCl to 25.0 mL of $0.43 \mathrm{M} \mathrm{NH}_{3}$ ? Use a table to look up relevant $K$ values.
3. For each of the following, decide whether the pH is less than, equal to, or greater than 7.
a. 150 mL of $0.20 \mathrm{M} \mathrm{HNO}_{3}$ is mixed with 75 mL of 0.40 M LiOH
b. equal volumes of 0.10 M acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$, and 0.10 M KOH are mixed
c. 25 mL of $0.015 \mathrm{M} \mathrm{NH}_{3}$ is mixed with 12 mL of 0.015 M HCl
d. 25 mL of $0.45 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ is mixed with 25 mL of 0.90 M NaOH
4. Does the pH of the solution increase, decrease or stay the same when you:
a. Add solid sodium oxalate, $\mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$, to 50.0 mL of 0.015 M oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ ?
b. Add solid ammonium chloride to 75 mL of 0.016 M HCl ?
c. Add 20.0 g of NaCl to 1.0 L of 0.10 M sodium acetate, $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$ ?
d. Add 10.3 g of $\mathrm{FeCl}_{3}$ to 1.0 L of pure water?
5. Which of the following combinations would be the best choice to buffer the pH of a solution at approximately 7? Use a table to look up relevant $K$ values.
a. $\mathrm{H}_{3} \mathrm{PO}_{4}$ and $\mathrm{NaH}_{2} \mathrm{PO}_{4}$
b. $\mathrm{NaH}_{2} \mathrm{PO}_{4}$ and $\mathrm{Na}_{2} \mathrm{HPO}_{4}$
c. $\mathrm{Na}_{2} \mathrm{HPO}_{4}$ and $\mathrm{Na}_{3} \mathrm{PO}_{4}$
6. What is the pH of 100 mL of 0.15 M acetic acid to which 1.56 g of sodium acetate, $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$, has been added? Use a table to look up relevant $K$ values.
7. Lactic acid, $\mathrm{CH}_{3} \mathrm{CHOHCO}_{2} \mathrm{H}$, is found in sour milk, in sauerkraut, and in muscles after activity. $K_{\mathrm{a}}$ for lactic acid $=1.4 \times 10^{-4}$.
a. If 2.75 g of $\mathrm{NaCH}_{3} \mathrm{CHOHCO}_{2}$, sodium lactate, is added to $5.00 \times 10^{2} \mathrm{~mL}$ of 0.100 M lactic acid, what is the pH of the resulting buffer solution?
b. Will the pH be lower or higher than the pH of the pure lactic acid solution?
8. Calculate the pH of a solution that has an ammonium chloride concentration of 0.050 M and an ammonia concentration of 0.045 M . Use a table to look up relevant $K$ values.
9. What mass of ammonium chloride, $\mathrm{NH}_{4} \mathrm{Cl}$, must be added to exactly $5.00 \times 10^{2} \mathrm{~mL}$ of 0.10 $\mathrm{M} \mathrm{NH}_{3}$ to give a solution with a pH of 9.00 ? Use a table to look up relevant $K$ values.
10. A buffer solution is composed of 1.360 g of $\mathrm{KH}_{2} \mathrm{PO}_{4}$ and 5.677 g of $\mathrm{Na}_{2} \mathrm{HPO}_{4}$. Use a table to look up relevant $K$ values.
a. What is the pH of the buffer solution?
b. What mass of $\mathrm{KH}_{2} \mathrm{PO}_{4}$ must be added to decrease the buffer solution pH by 0.5 units?

Problem Set \#3 continues on the next page
11. You dissolve 0.425 g of NaOH in 2.00 L of a buffer solution that has $\left[\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}\right]=\left[\mathrm{HPO}_{4}{ }^{2-}\right]=$ 0.132 M . What is the pH of the solution before adding the NaOH ? After adding the NaOH ? Use a table to look up relevant $K$ values.
12. What will be the pH change when 20.0 mL of 0.100 M NaOH is added to 80.0 mL of a buffer solution consisting of $0.169 \mathrm{M} \mathrm{NH}_{3}$ and $0.183 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ ? Use a table to look up relevant $K$ values.
13. Assume you dissolve 0.235 g of the weak acid benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}$, in enough water to make $1.00 \times 10^{2} \mathrm{~mL}$ of solution and then titrate the solution with 0.108 M NaOH . Use a table to look up relevant $K$ values.

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{OH}^{-1}(\mathrm{aq}) \rightleftharpoons \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}^{-1}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)
$$

a. What is the pH of the original benzoic acid solution?
b. What are the concentrations of the following ions at the equivalence point? $\mathrm{Na}^{+}$, $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OH}^{-}$, and $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}^{-}$? What is the pH at the equivalence point?
14. A solution of the weak base aniline, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}, K_{\mathrm{b}}=4.0 \times 10^{-10}$, in 25.0 mL of water requires 25.67 mL of 0.175 M HCl to reach the equivalence point.

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \rightleftharpoons \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}+(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)
$$

a. What was the concentration of the aniline in the original solution?
b. What are the concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OH}^{-}$and $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}$at the equivalence point? What is the pH of the solution at the equivalence point?

Table of Acids and Bases for CH 223

[^3]$\qquad$
Worksheet due dates: Mon, 4/29, 1:10 PM (01), Wed, 5/1, 1:10 PM (H1) or 11:59 PM (W1, email). To complete, show detailed steps on how to get the given answer for each problem. Failure to use this form for work and answers will result in a point penalty.

Problem 1: Consider the following equilibrium: $\mathbf{2} \mathbf{N O C l}(\mathrm{g}) \rightleftharpoons 2 \mathbf{N O}(\mathrm{~g})+\mathbf{C l}_{\mathbf{2}}(\mathrm{g})$ where $\mathrm{K}=1.6$ * $\mathbf{1 0}^{-\mathbf{5}}$
1.0 mol of pure NOCl and 1.0 mol of pure $\mathrm{Cl}_{2}$ are placed in a 1.00 L container. Calculate the equilibrium concentration of $\mathrm{NO}(\mathrm{g})$ and $\mathrm{Cl}_{2}(\mathrm{~g})$. To receive credit, show a complete ICE table.

Answer to Problem \#1: $[\mathrm{NO}(\mathrm{g})]=\mathbf{4 . 0}{ }^{*} \mathbf{1 0}^{-\mathbf{3}} \mathbf{M},\left[\mathbf{C l}_{\mathbf{2}}(\mathrm{g})\right]=\mathbf{1 . 0} \mathbf{M}$

Problem 2: How many moles of benzoic acid, a monoprotic acid with $\mathrm{K}_{\mathrm{a}}=6.4{ }^{*} 10^{-5}$, must be dissolved in $500 . \mathrm{mL}^{\text {of }} \mathrm{H}_{2} \mathrm{O}$ to produce a solution with $\mathrm{pH}=2.50$ ?

Answer to Problem \#2: 7.9 * 10-2 mol (answers $\pm 0.1$ ok, depends on method used to solve)
Problem 3: Complete the following problems using correct significant figures:

$$
\left[\mathrm{H}^{+}\right]=0.001501 \mathrm{M}, \text { and } \mathrm{pH}=
$$

$$
\mathrm{pK}_{\mathrm{b}}=10.35, \text { and } \mathrm{K}_{\mathrm{b}}=
$$

Problem 4: You have solutions of $0.200 \mathrm{M} \mathrm{HNO}_{2}$ and $0.200 \mathrm{M} \mathrm{KNO}_{2}\left(\mathrm{~K}_{\mathrm{a}}\right.$ for $\left.\mathrm{HNO}_{2}=4.00 * 10^{-4}\right)$. A buffer of pH 3.00 is needed. What volumes of $\mathrm{HNO}_{2}$ and $\mathrm{KNO}_{2}$ are required to make 1 liter of buffered solution? (Hints: $1000 \mathrm{~mL}=V_{w a}+V_{w b}$ and: rewrite Henderson-Hasselbalch, substituting $n_{w b} / n_{w a}$ for $C_{w b} V_{w b} / C_{w a} V_{w a}$ (because $n_{w a}=C_{w a} V_{w a}$, etc.))

Answer to Problem \#4: $\mathbf{7 1 5} \mathbf{~ m L}$ of $\mathbf{H N O}_{\mathbf{2}}$ and $\mathbf{2 8 5} \mathbf{~ m L}$ of $\mathrm{KNO}_{\mathbf{2}}, \pm \mathbf{1} \mathbf{~ m L} \mathbf{~ o k}$
Problem 5: What is the pH of a solution that results when $0.010 \mathrm{~mol} \mathrm{HNO}_{3}$ is added to $500 . \mathrm{mL}$ of a solution that is 0.10 M in aqueous ammonia and 0.20 M in ammonium nitrate? Assume no volume change, and $\mathrm{K}_{\mathrm{b}}$ for $\mathrm{NH}_{3}=1.8 * 10^{-5}$ )

Answer to Problem \#5: $\mathbf{p H}=\mathbf{8 . 8 2}$
Problem 6: You dissolve 1.00 g of an unknown diprotic acid in 200.0 mL of $\mathrm{H}_{2} \mathrm{O}$. The solution is just neutralized by 5.00 mL of a 1.00 M NaOH solution. What is the molar mass of the unknown acid?

# CH 223 Spring 2024: Problem Set \#4 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#4 by reading Chapter 15 and Chapter 16 of the textbook and/or by watching the videos found on our website (https:// mhchem.org/223)
- Try the problems for Problem Set \#4 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
Section 01 and H1: We will go over Problem Set \#4 during recitation. Self correct all problems of your problem set before turning it in at the end of recitation.

- Section 01: due Monday, May 13 at 1:10 PM
- Section H1: due Wednesday, May 15 at 1:10 PM

Section W1: Watch the recitation video for Problem Set \#4:

## http://mhchem.org/v/r.htm

- Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.)
- Submit Problem Set \#4 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, May 15.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#4

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

Covering: Chapter Fifteen (solubility), Chapter Sixteen and Chapter Guide Four
Important Tables and/or Constants: Solubility Table (from the CH 221 Net Ionics lab or here: https://mhchem.org/ sol), "Solubility Product Constant ( $\mathbf{K}_{\mathbf{s p}}$ ) Values at $25^{\circ} \mathbf{C}$ " and "Complex Ion Formation Constant ( $\mathbf{K}_{\mathbf{f}}$ ) Values at $\mathbf{2 5}{ }^{\circ} \mathbf{C} "$ at the end of problem set \#4, "Solubility Guide" (Handout), Table of Thermodynamic Values (found at the end of CH 223 Problem Set \#5 or here: http://mhchem.org/thermo)

1. Using a solubility table, predict whether the following are insoluble or soluble in water.
a. $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$
b. $\mathrm{Fe}(\mathrm{OH})_{3}$
c. $\mathrm{ZnCl}_{2}$
d. CuS
2. a. For $\mathrm{PbSO}_{4}$ and $\mathrm{BaF}_{2}$, (i) write a balanced equation showing the equilibrium occurring when each insoluble salt is added separately to water, and (ii) write the $K_{\text {sp }}$ expression.
b. Write a balanced equation showing the equilibrium occurring for the formation of the complex ion $\mathbf{Z n}\left(\mathbf{N H}_{3}\right) 4^{\mathbf{2 +}}(\mathrm{aq})$ and write the corresponding $K_{f}$ expression.
3. At $20^{\circ} \mathrm{C}$, a saturated aqueous solution of silver(I) acetate, $\mathrm{AgCH}_{3} \mathrm{CO}_{2}$, contains 0.74 g of the silver compound dissolved in 100.0 mL of solution. Calculate $K_{\text {sp }}$ for silver(I) acetate.

$$
\mathrm{AgCH}_{3} \mathrm{CO}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2}^{-1}(\mathrm{aq})
$$

4. What is the molar concentration of $\mathrm{Au}^{+}(\mathrm{aq})$ in a saturated solution of $\mathrm{AuCl}\left(K_{\mathrm{sp}}=2.0 \times 10^{-13}\right)$ in pure water at $25^{\circ} \mathrm{C}$ ? The equation:

$$
\mathrm{AuCl}(\mathrm{~s}) \rightleftharpoons \mathrm{Au}^{+}(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq})
$$

5. Estimate the solubility of lead(II) bromide (a) in moles per liter and (b) in grams per liter of pure water. ( $K_{\text {sp }}$ for lead(II) bromide $=6.6 \times 10^{-6}$ )
6. If 75 mg of lead(II) sulfate is placed in 250 mL of pure water, does all of it dissolve? If not, how much dissolves? $\left(K_{\text {sp }}\right.$ for lead(II) sulfate $\left.=2.5 \times 10^{-8}\right)$
7. You place 2.234 g of solid $\mathrm{Ca}(\mathrm{OH})_{2}$ in 1.00 L of pure water at $25^{\circ} \mathrm{C}$. The pH of the solution is found to be 12.68 . Estimate the $K_{\text {sp }}$ for $\mathrm{Ca}(\mathrm{OH})_{2}$.
8. Which compound in each of the following pairs is the more soluble?
a. $\mathrm{AgBr}\left(K_{\mathrm{sp}}=5.0 \times 10^{-13}\right)$ or $\operatorname{AgSCN}\left(K_{\mathrm{sp}}=1.0 \times 10^{-12}\right)$
b. $\mathrm{SrCO}_{3}\left(K_{\mathrm{sp}}=9.3 \times 10^{-10}\right)$ or $\mathrm{SrSO}_{4}\left(K_{\mathrm{sp}}=3.4 \times 10^{-7}\right)$
c. $\mathrm{AgI}\left(K_{\text {sp }}=8.3 \times 10^{-17}\right)$ or $\mathrm{PbI}_{2}\left(K_{\text {sp }}=9.8 \times 10^{-9}\right)$
9. What is the solubility, in milligrams per milliliter, of $\mathrm{BaF}_{2}$ (a) in pure water, and (b) in water containing $5.0 \mathrm{mg} / \mathrm{mL} \mathrm{KF}$ ? $\left(K_{\text {sp }}\right.$ for $\left.\mathrm{BaF}_{2}=1.8 \times 10^{-7}\right)$
10. Sodium carbonate is added to a solution in which the concentration of $\mathrm{Ni}^{2+}$ ion is 0.0024 M . Will precipitation of $\mathrm{NiCO}_{3}\left(K_{\text {sp }}=1.4 \times 10^{-7}\right)$ occur (a) when the concentration of the carbonate ion is $1.0 \times 10^{-6} \mathrm{M}$ or (b) when it is 100 times greater (or $1.0 \times 10^{-4} \mathrm{M}$ )? The equation: $\quad \mathrm{NiCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{Ni}^{2+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$
11. You have 95 mL of a solution that has a lead(II) concentration of 0.0012 M . Will $\mathrm{PbCl}_{2}$ precipitate when 1.20 g of solid NaCl is added? $\left(K_{\mathrm{sp}}\right.$ for $\left.\mathrm{PbCl}_{2}=1.7 \times 10^{-5}\right)$

## Problem Set \#4 continues on the next page

12. Solid silver(I) iodide, AgI, can be dissolved by adding aqueous sodium cyanide to it (see equation below.) Show that this equation is the sum of two other equations, one for dissolving $\mathrm{AgI}\left(K_{\mathrm{sp}}=8.3 \times 10^{-17}\right)$ to give its ions and the other for the formation of the $\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-1}$ ion $\left(K_{\mathrm{f}}=1.3 \times 10^{21}\right)$ from $\mathrm{Ag}^{+}$and $\mathrm{CN}^{-1}$. Calculate $K_{\text {net }}$ for the overall reaction. The equation:

$$
\mathrm{AgI}(\mathrm{~s})+2 \mathrm{CN}^{-1}(\mathrm{aq}) \rightleftharpoons\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-1}(\mathrm{aq})+\mathrm{I}(\mathrm{aq})
$$

13. You have a solution with aqueous $\mathrm{Cu}^{2+}$ and $\mathrm{Ag}^{+}$ions. Using a table of solubility product constants, devise a way to separate these ions by adding one reagent to precipitate one of them as an insoluble salt and leave the other in solution.
14. A solution contains 0.10 M iodide ion, $\mathrm{I}^{-1}$, and 0.10 M carbonate ion, $\mathrm{CO}_{3}{ }^{2-}$.
a. If solid $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ is slowly added to the solution, which salt will precipitate first, $\mathrm{PbI}_{2}$ or $\mathrm{PbCO}_{3}$ ? $\left(K_{\text {sp }}\right.$ for $\mathrm{PbI}_{2}=9.8 \times 10^{-9}, K_{\text {sp }}$ for $\left.\mathrm{PbCO}_{3}=7.4 \times 10^{-14}\right)$
b. What will be the concentration of the first ion that precipitates $\left(\mathrm{CO}_{3}{ }^{2-}\right.$ or $\left.\mathrm{I}^{-1}\right)$ when the second, more soluble salt begins to precipitate?
15. Which substance has the higher entropy in each of the following pairs?
a. a sample of pure silicon (to be used in a computer chip) or a piece of silicon containing traces of other elements such as boron or phosphorus
b. $\mathrm{O}_{2}(\mathrm{~g})$ at $0{ }^{\circ} \mathrm{C}$ or $\mathrm{O}_{2}(\mathrm{~g})$ at $-50^{\circ} \mathrm{C}$
c. $\mathrm{I}_{2}(\mathrm{~s})$ or $\mathrm{I}_{2}(\mathrm{~g})$, both at room temperature
d. $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})$ or $\mathrm{N}_{2}(\mathrm{~g})$ (two substances with the same molar mass)
16. Using a table of $S^{\circ}$ values, calculate the entropy change, $\Delta S^{\circ}$, for each of the following changes and comment on the sign of the change.
a. $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\ell) \rightarrow \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{g})$
b. $\mathrm{CCl}_{4}(\mathrm{~g}) \rightarrow \mathrm{CCl}_{4}(\ell)$
17. Calculate the standard molar entropy change of formation $\left(\Delta \mathrm{S}_{f}{ }^{0}\right)$ for each of the following compounds from the elements at $25^{\circ} \mathrm{C}$.
a. $\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$ (Note: sulfur is an octamer $\left(\mathrm{S}_{8}\right)$ )
b. $\mathrm{Li}_{2} \mathrm{CO}_{3}(\mathrm{~s})$

## Solubility Product Constant ( $\mathrm{K}_{\text {sp }}$ ) Values at $25{ }^{\circ} \mathrm{C}$

| Formation Equilibrium | $K$ |
| :---: | :---: |
| $\mathrm{Ag}^{+}+2 \mathrm{Br}^{-} \rightleftarrows\left[\mathrm{AgBr}_{2}\right]^{-}$ | $2.1 \times 10^{7}$ |
| $\mathrm{Ag}^{+}+2 \mathrm{Cl}^{-} \rightleftarrows\left[\mathrm{AgCl}_{2}\right]^{-}$ | $1.1 \times 10^{5}$ |
| $\mathrm{Ag}^{+}+2 \mathrm{CN}^{-} \rightleftarrows\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$ | $1.3 \times 10^{21}$ |
| $\mathrm{Ag}^{+}+2 \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-} \rightleftarrows\left[\mathrm{Ag}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}$ | $2.9 \times 10^{13}$ |
| $\mathrm{Ag}^{+}+2 \mathrm{NH}_{3} \rightleftarrows\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$ | $1.1 \times 10^{7}$ |
| $\mathrm{Al}^{3+}+6 \mathrm{~F}^{-} \rightleftarrows\left[\mathrm{AlF}_{6}\right]^{3-}$ | $6.9 \times 10^{19}$ |
| $\mathrm{Al}^{3+}+4 \mathrm{OH}^{-} \rightleftarrows\left[\mathrm{Al}(\mathrm{OH})_{4}\right]^{-}$ | $1.1 \times 10^{33}$ |
| $\mathrm{Au}^{+}+2 \mathrm{CN}^{-} \rightleftarrows\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$ | $2.0 \times 10^{38}$ |
| $\mathrm{Cd}^{2+}+4 \mathrm{CN}^{-} \rightleftarrows\left[\mathrm{Cd}(\mathrm{CN})_{4}\right]^{2-}$ | $6.0 \times 10^{18}$ |
| $\mathrm{Cd}^{2+}+4 \mathrm{NH}_{3} \rightleftarrows\left[\mathrm{Cd}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ | $1.3 \times 10^{7}$ |

*Data reported in this table are taken from J. A. Dean: Lange's Handbook of Chemistry, 15th ed. New York: McGraw-Hill Publishers, 1999.

## Complex Ion Formation Constant ( $\mathrm{K}_{\mathrm{f}}$ ) Values at $25^{\circ} \mathrm{C}$

The values reported in this table were taken from J. A. Dean: Lange's Handbook of Chemistry, 15th ed. New York: McGraw-Hill Publishers, 1999. Values have been rounded off to two significant figures.
*Calculated solubility from these $K_{\text {sp }}$ values will match experimental solubility for this compound within a factor of 2. Experimental values for solubilities are given in R. W. Clark and J. M. Bonicamp: Journal of Chemical Education, Vol. 75, p. 1182, 1998.

# CH 223 Spring 2024: Problem Set \#5 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#5 by reading Chapter 16 and Chapter 17 of the textbook and/or by watching the videos found on our website (https:// mhchem.org/223)
- Try the problems for Problem Set \#5 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
Section 01 and H1: We will go over Problem Set \#5 during recitation. Self correct all problems of your problem set before turning it in at the end of recitation.

- Section 01: due Monday, May 20 at 1:10 PM
- Section H1: due Wednesday, May 22 at 1:10 PM

Section W1: Watch the recitation video for Problem Set \#5:

## http://mhchem.org/v/t.htm

- Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.)
- Submit Problem Set \#5 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, May 22.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#5

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

Covering: Chapter Sixteen, Chapter Seventeen and Chapter Guide Five
Important Tables and/or Constants: $\mathbf{F}=\mathbf{9 6 4 8 5} \mathbf{C} / \mathbf{m o l} \mathbf{e}^{-}, \mathbf{R}=\mathbf{8 . 3 1 4 5} \mathbf{J ~ m o l}^{-1} \mathbf{K}^{-1}$, "Redox Reactions" (Handout), Table of Redox Potentials at the end of this problem set, Table of Thermodynamic values at the end of this problem set and here: http://mhchem.org/thermo

1. Classify each of the reactions according to their spontaneity. Are these reactions enthalpy and/or entropy driven?
a. $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{~s})+6 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 6 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\ell) \Delta H^{\circ}=-673 \mathrm{~kJ} \quad \Delta S^{\circ}=60.4 \mathrm{~J} / \mathrm{K}$
b. $\mathrm{MgO}(\mathrm{s})+\mathrm{C}$ (graphite) $\rightarrow \mathrm{Mg}(\mathrm{s})+\mathrm{CO}(\mathrm{g}) \quad \Delta H^{\circ}=490.7 \mathrm{~kJ} \quad \Delta S^{\circ}=197.9 \mathrm{~J} / \mathrm{K}$
2. Use a Table to calculate $\Delta H^{\circ}$ and $\Delta S^{\circ}$ for the reaction of silicon(IV) oxide with carbon:

$$
\mathrm{SiO}_{2}(\mathrm{~s})+\mathrm{C}(\text { graphite }) \rightarrow \mathrm{Si}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

a. Is the reaction spontaneous at 298 K ?
b. Is the reaction predicted to be spontaneous at higher temperatures?
3. Using values of $\Delta H_{f}^{\circ}$ and $S^{\circ}$, calculate $\Delta G^{\circ}{ }_{\mathrm{rxn}}$ for each of the following reactions. Which of these reactions is (are) predicted to be product-favored? Are the reactions enthalpy or entropy driven?
a. $\mathrm{Ba}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{O}(\ell) \rightarrow \mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq})+2 \mathrm{H}_{2}(\mathrm{~g})$
(Note: for $\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq}), \Delta H^{\circ}=-1002.82 \mathrm{~kJ} / \mathrm{mol}$ and $S^{\circ}=74.5 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ )
b. 6 C (graphite) $+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{C}_{6} \mathrm{H}_{6}(\ell)$
4. Using values of $\Delta G^{\circ}$, calculate $\Delta G_{\mathrm{rxn}}^{\circ}$ for each of the following reactions. Which are product-favored?
a. $\mathrm{HgS}(\mathrm{s}$, red $)+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{Hg}(\ell)+\mathrm{SO}_{2}(\mathrm{~g})$
b. $2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})+2 \mathrm{SO}_{2}(\mathrm{~g})$
5. Estimate the temperature required to decompose $\mathrm{CaSO}_{4}(\mathrm{~s})$ into $\mathrm{CaO}(\mathrm{s})$ and $\mathrm{SO}_{3}(\mathrm{~g})$ using values of $\Delta H^{\circ}{ }_{f}$ and $S^{\circ}$.
6. The formation of $\mathrm{O}_{3}(\mathrm{~g})$ from $\mathrm{O}_{2}(\mathrm{~g})$ has a standard free energy change, $\Delta G^{\circ}$, of $+163.2 \mathrm{~kJ} / \mathrm{mol}$ at $25^{\circ} \mathrm{C}$. Calculate $K_{\mathrm{p}}$ at this temperature. Comment on the connection between the sign of $\Delta G^{\circ}$ and the magnitude of $K_{\mathrm{p}}$.
7. Write balanced equations for the following half-reactions. Specify whether each is an oxidation or reduction.
a. $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})$ (in acid)
b. $\mathrm{NO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{NO}(\mathrm{g})$ (in acid)
c. $\mathrm{MnO}_{4}^{-1}(\mathrm{aq}) \rightarrow \mathrm{MnO}_{2}$ (s) (in base)
8. Balance the following redox equations. All occur in acid solution.
a. $\mathrm{Sn}(\mathrm{s})+\mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Sn}^{2+}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
b. $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+\mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{Fe}^{3+}(\mathrm{aq})$

Problem Set \#5 continues on the next page

Problem Set \#5, Continued from previous page
9. Balance the following redox reactions. All occur in basic solution.
a. $\mathrm{NiO}_{2}(\mathrm{~s})+\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Ni}(\mathrm{OH})_{2}(\mathrm{~s})+\mathrm{Zn}(\mathrm{OH})_{2}(\mathrm{~s})$
b. $\mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{~s})+\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{OH})_{3}(\mathrm{~s})+\left[\mathrm{Cr}(\mathrm{OH})_{4}\right]^{-1}$
10. The following voltaic cell is created: $\mathrm{Ag}(\mathrm{s})\left|\mathrm{Ag}^{+}(\mathrm{aq}) \| \mathrm{Cl}_{2}(\mathrm{~g}, 1 \mathrm{~atm})\right| \mathrm{Cl}^{-1}(\mathrm{aq}, 1.0 \mathrm{M}) \mid \mathrm{Pt}(\mathrm{s})$
a. Write equations for the oxidation and reduction half-reactions and for the overall (cell) reaction.
b. Which half-reaction occurs in the anode compartment and which occurs in the cathode compartment?
c. Complete the following sentences: Electrons in the external circuit flow from the ___ electrode to the $\qquad$ electrode. Negative ions move in the salt bridge from the $\qquad$ half-cell to the $\qquad$ half-cell.
11. Balance each of the following unbalanced equations, then calculate the standard reduction potential, $E^{\circ}$, and decide whether each is product-favored as written. All reactions occur in acidic solution.
a. $\mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{Cu}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Cu}(\mathrm{s})+\mathrm{Fe}^{3+}(\mathrm{aq})$
b. $\mathrm{MnO}_{4}^{-1}(\mathrm{aq})+\mathrm{NO}(\mathrm{g}) \rightarrow \mathrm{Mn}^{2+}(\mathrm{aq})+\mathrm{NO}_{3}{ }^{-1}(\mathrm{aq})$
12. Calculate the potential at 298 K developed by a voltaic cell using the following reaction if all dissolved species are 0.015 M : (hint: use the Nernst equation!)

$$
2 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 2 \mathrm{Fe}^{3+}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\ell)
$$

13. Calculate $\Delta G^{\circ}$ and the equilibrium constant for the following reaction:

$$
\mathrm{Cu}(\mathrm{~s})+2 \mathrm{Ag}^{+}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{Ag}(\mathrm{~s})
$$

14. In the electrolysis of a solution containing $\mathrm{Ag}^{+}(\mathrm{aq})$, metallic $\mathrm{Ag}(\mathrm{s})$ deposits on the cathode. Using a current of 1.12 A for 2.40 h , what mass of silver forms?

## Standard Reduction Potentials in Aqueous Solution at $25^{\circ} \mathrm{C}$

* In volts (V) versus the standard hydrogen electrode.

Standard Thermodynamic Properties for Selected Substances

Blank page for printing purposes!
$\qquad$
Worksheet due dates: Wed, 5/29: 9AM AC 1303 (01), 1:10 PM AC 2501 (H1), 11:59 PM (W1, email). Show detailed steps on how to get the given answer for each problem. Failure to use this form for work and answers will result in a point penalty.

Problem 1: How many grams of $\mathrm{Fe}(\mathrm{OH})_{2}\left(\mathrm{~K}_{\text {sp }}=1.8 * 10^{-15}\right)$ will dissolve in one liter of water buffered at $\mathrm{pH}=12.00$ ?

Answer to Problem \#1: $\mathbf{1 . 6}$ * $\mathbf{1 0}^{-9} \mathbf{g}$

Problem 2: Given that $\Delta \mathrm{G}^{\circ}{ }_{\mathrm{f}}$ for $\mathrm{NH}_{3}=-16.67 \mathrm{~kJ} / \mathrm{mol}$, calculate the equilibrium constant for the following reaction at 298 K :

$$
\mathbf{N}_{2}(\mathbf{g})+\mathbf{3} \mathbf{H}_{2}(\mathbf{g}) \rightleftharpoons \mathbf{2} \mathbf{N H}_{3}(\mathbf{g})
$$

Problem 3: Using the unbalanced reaction buffered at $\mathrm{pH}=4.41$ show below, determine the number of electrons transferred during the reaction. (Show the balanced reaction for credit!)

$$
\mathrm{ClO}_{3}^{-1}(\mathrm{aq})+\mathrm{I}^{-1}(\mathrm{aq}) \rightarrow \mathbf{I}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

## Answer to Problem \#3: Ten electrons are transferred.

Problem 4: Determine $\Delta \mathrm{G}^{\circ}$ for a cell that utilizes the following reaction:

$$
\mathrm{Cl}_{2}(\mathrm{~g})+2 \mathrm{Br}^{-1}(\mathrm{aq}) \rightarrow 2 \mathrm{Cl}^{-1}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{l})
$$

The standard reduction for the chlorine is 1.360 V and the standard reduction for the bromine liquid is 1.077 V .

Answer to Problem \#4: -54.6 kJ

Problem 5: If an electrolysis plant operates its electrolytic cells at a total current of $1.0 \times 10^{6} \mathrm{amp}$, how long will it take to produce one metric ton (one million grams) of $\mathrm{Mg}(\mathrm{s})$ from seawater containing $\mathrm{Mg}^{2+}$ ?

# CH 223 Spring 2024: Problem Set \#6 Instructions 

Step One (all sections):

- Learn the material for Problem Set \#6 by reading Chapter 18 and Chapter 19 of the textbook and/or by watching the videos found on our website (https://mhchem.org/223)
- Try the problems for Problem Set \#6 found on the next pages on your own first. Use separate paper and write out your answers, showing all of your work. If you write the answers on the problem set itself, you will receive fewer points. Include your name on your problem set!

Step Two:
All sections: Watch the recitation video for Problem Set \#6:
http://mhchem.org/v/x.htm
Self correct all of the problems while viewing the video. Mark correct problems with a star (or other similar mark), and correct all incorrect problems (show the correct answer and the steps required to achieve it.) Note that Section 01 and Section H1 will not be going over this problem set in recitation.

Due dates:

- Section 01: due Wednesday, June 5 at 9 AM in AC 1303
- Section H1: due Wednesday, June 5 at 1:10 PM in AC 2501
- Section W1: Submit Problem Set \#6 via email (mike.russell@mhcc.edu) as a single PDF file (use CamScanner (https://camscanner.com), CombinePDF (https:// combinepdf.com), etc.) by 11:59 PM Wednesday, June 5.

If you have any questions regarding this assignment, please email (mike.russell@mhcc.edu) the instructor! Good luck on this assignment!

## CH 223 Problem Set \#6

* Complete problem set on separate pieces of paper showing all work, circling final answers, etc.
* Self correct your work before turning it in to the instructor.

Covering: Chapters Eighteen and Chapter Nineteen and Chapter Guide Six
Important Tables and/or Constants: "Coordination Compounds" (Handout)

1. Write an equation for the reaction of potassium and hydrogen. Name the product. Is it ionic or covalent? Predict one physical property and one chemical property of this compound.
2. Write an equation for the reaction of sodium with each of the halogens. Predict at least two physical properties that are common to all of the alkali metal halides.
3. $\mathrm{Ca}(\mathrm{OH})_{2}$ has a $K_{\text {sp }}$ of $5.5 \times 10^{-5}$, whereas $K_{\text {sp }}$ for $\mathrm{Mg}(\mathrm{OH})_{2}$ is $5.6 \times 10^{-12}$. Calculate the equilibrium constant for the reaction:

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})+\mathrm{Mg}^{2+}(\mathrm{aq}) \rightleftharpoons \mathrm{Ca}^{2+}(\mathrm{aq})+\mathrm{Mg}(\mathrm{OH})_{2}(\mathrm{~s})
$$

Explain why this reaction can be used in the commercial isolation of magnesium from seawater.
4. Gallium hydroxide, like aluminum hydroxide, is amphoteric
a. Write balanced equations for the reaction of solid $\mathrm{Ga}(\mathrm{OH})_{3}$ with aqueous HCl and NaOH .
b. What volume of 0.0112 M HCl is needed to react completely with 1.25 g of $\mathrm{Ga}(\mathrm{OH})_{3}$ ?
5. Use data in the Thermodynamic Table in Problem Set \#5 to calculate the enthalpy and free energy change for the reaction: $\quad 2 \mathrm{NO}_{2}(\mathrm{~g}) \rightarrow \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$
Is this reaction exothermic or endothermic? Is the reaction product- or reactant-favored?
6. The overall reaction involved in the industrial synthesis of nitric acid is:

$$
\mathrm{NH}_{3}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)
$$

a. Calculate $\Delta G^{\circ}$ for this reaction. Note: $\Delta G^{\circ}$ for $\mathrm{HNO}_{3}(\mathrm{aq})=-111.25 \mathrm{~kJ} / \mathrm{mol}$
b. Calculate the equilibrium constant for this reaction at $25^{\circ} \mathrm{C}$.
7. Sulfur forms a range of compounds with fluorine. Draw Lewis electron dot structures for $\mathrm{S}_{2} \mathrm{~F}_{2}$ (connectivity is FSSF ), $\mathrm{SF}_{2}, \mathrm{SF}_{4}, \mathrm{SF}_{6}$ and $\mathrm{S}_{2} \mathrm{~F}_{10}$. What is the oxidation number of sulfur in each of these compounds?
8. The halogen oxides and oxoanions are good oxidizing agents. For example, the reduction of bromate ion has an $E^{\circ}$ value of 1.44 V in acid solution:

$$
2 \mathrm{BrO}_{3}^{-1}(\mathrm{aq})+12 \mathrm{H}^{+}(\mathrm{aq})+10 \mathrm{e}^{-} \rightarrow \mathrm{Br}_{2}(\mathrm{aq})+6 \mathrm{H}_{2} \mathrm{O}(\ell)
$$

Is it possible to oxidize aqueous $1.0 \mathrm{M} \mathrm{Mn}^{2+}$ to aqueous $\mathrm{MnO}_{4}{ }^{-1}$ with 1.0 M bromate ion? Use the redox table in Problem Set \#5 to answer this problem.
9. The hypohalite ions, $\mathrm{XO}^{-1}$, are the anions of weak acids. Calculate the pH of a 0.10 M solution of NaClO . What is the concentration of HClO in this solution? $K_{\mathrm{b}}\left(\mathrm{ClO}^{-}\right)=2.9 * 10^{-7}$
10. Identify two transition metals ions with the following electron configurations:
a. $[\mathrm{Ar}] 3 d^{6}$
b. $[\mathrm{Ar}] 3 d^{10}$
c. $[\mathrm{Ar}] 3 d^{5}$
d. $[\mathrm{Ar}] 3 d^{8}$
11. Match up the isoelectronic ions in the following list:

$$
\mathrm{Cu}^{+} \mathrm{Mn}^{2+} \mathrm{Fe}^{2+} \mathrm{Co}^{3+} \mathrm{Fe}^{3+} \mathrm{Zn}^{2+} \mathrm{Ti}^{2+} \mathrm{V}^{3+}
$$

Problem Set \#6 continues on the next page
12. Identify the products of each reaction and balance the equation:
a. $\mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \rightarrow$
b. $\mathrm{Zn}(\mathrm{s})+\mathrm{HCl}(\mathrm{aq}) \rightarrow$
13. One of the following nitrogen compounds or ions is not capable of serving as a ligand: $\mathrm{NH}_{4}{ }^{+}$, $\mathrm{NH}_{3}, \mathrm{NH}_{2}{ }^{-1}$. Identify this species and explain your answer.
14. Give the oxidation number of the metal in each of the following complexes:
a. $\left[\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{6}\right]^{2+}$
b. $\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}$
c. $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5}\left(\mathrm{NO}_{2}\right)\right]^{+}$
d. $\left[\mathrm{Cu}(\mathrm{en})_{2}\right]^{2+}$
15. Give the formula of a complex constructed from one $\mathrm{Cr}^{3+}$ ion, two ethylenediamine ligands, and two ammonia molecules. Is the complex neutral or is it charged? If charged, give the charge.
16. Write formulas for the following ions or compounds:
a. diamminetriaquahydroxochromium(II) nitrate
b. hexaammineiron(III) nitrate
c. pentacarbonyliron $(0)$ (where the ligand is CO )
d. ammonium tetrachlorocuprate(II)
17. Name the following ions or compounds:
a. $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4} \mathrm{Cl}_{2}\right]^{+}$
b. $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3} \mathrm{~F}_{3}$
c. $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}\right]^{-1}$
d. $\left[\mathrm{Co}(\mathrm{en})\left(\mathrm{NH}_{3}\right)_{3} \mathrm{Cl}\right]^{2+}$
18. Give the name or formula for each ion or compound as appropriate:
a. tetraaquadichlorochromium(III) chloride
b. $\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{SO}_{4}\right] \mathrm{Cl}$
c. sodium tetrachlorocobaltate(II)
d. trans-diaquadioxalatochromate(III) ion (oxalato $=$ oxalate ion)
e. $\left[\mathrm{Rh}(\mathrm{en})_{3}\right]^{3+}$
19. In which of the following complexes are geometric isomers possible? If isomers are possible, draw their structures and label them as cis or trans, or as fac or mer.
a. $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4} \mathrm{Cl}_{2}\right]^{+}$
b. $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{3} \mathrm{~F}_{3}$
c. $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}\right]^{-1}$
d. $\left[\mathrm{Co}(\mathrm{en})_{2}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}\right]^{2+}$
e. Does 2-butanol exhibit optical isomerism? Draw a Lewis structure and explain.
20. A platinum-containing compound, known as Magnus's green salt, has the overall formula $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{4}\right]\left[\mathrm{PtCl}_{4}\right]$ (in which both platinum ions are $\mathrm{Pt}^{2+}$ ). Name the cation and the anion.

## Blank page for printing purposes only!

$\qquad$
Worksheet due dates: Wed, 6/5: 9AM AC 1303 (01), 1:10 PM AC 2501 (H1), 11:59 PM (W1, email). Show detailed steps on how to get the given answer for each problem. Failure to use this form for work and answers will result in a point penalty.

Problem 1: Lauryl alcohol is obtained from coconut oil and is used to make detergents. A solution of 5.00 g of lauryl alcohol in 100. grams of benzene freezes at $4.1^{\circ} \mathrm{C}$. What is the molar mass of lauryl alcohol? (for benzene, $\mathrm{k}_{\mathrm{fp}}=5.12{ }^{\circ} \mathrm{C} / \mathrm{m}$; normal freezing point of benzene $=5.5^{\circ} \mathrm{C}$ )

Problem 2: Rubidium has an atomic weight of 85.470 and two primary isotopes, namely rubidium-85 (84.9118 amu) and rubidium-87 (86.9092 amu). Calculate the abundance of each isotope.

Problem 3: Determine both the molecular and net ionic equations for the following reactions. To get credit for this problem, both equations must be listed for each problem, and all states of matter (and charges) provided.

## a. Lead(II) nitrate is mixed with sodium iodide.

Molecular (balanced) equation:

Net ionic equation:
b. Aqueous strontium hydroxide is mixed with chromium(III) chloride.

Molecular (balanced) equation:

Net ionic equation:

Hints for Problem \#3: $a . \mathbf{P b I}_{2}(\mathbf{s})$ and $b . \mathbf{C r}(\mathbf{O H})_{3}(\mathbf{s})$

Problem 4: Three pH problems:

Calculate the pH of a 0.200 M NaOH solution.

Calculate the pH of a 0.200 M acetic acid solution. $K_{\mathrm{a}}=1.8 \times 10^{-5}$
$\mathrm{pH}=$ $\qquad$

Calculate the pH of a solution containing 220. mL of 0.115 M pyridine $\left(K_{\mathrm{b}}=1.4 \mathrm{x}\right.$ $10^{-9}$ ) and $150 . \mathrm{mL}$ of 0.100 M HCl .

$$
\mathrm{pH}=
$$

$\qquad$

Answer to Problem \#4: 13.301, 2.72 and 4.99 (4.98 ok)

Problem 5: Determine the rate law for the following reaction and the value of the rate constant, $k . \quad \mathbf{2} \mathbf{N O}(\mathbf{g})+\mathbf{O}_{\mathbf{2}}(\mathrm{g}) \rightarrow \mathbf{2} \mathbf{N O}_{\mathbf{2}}(\mathbf{g})$

| Experiment | $[\mathbf{N O}](\mathbf{M})$ | $\left[\mathbf{O}_{2}\right](\mathbf{M})$ | Rate $(\mathbf{M} / \mathbf{s})$ |
| :---: | :---: | :---: | :---: |
| 1 | 0.0126 | 0.0125 | $1.41 \times 10^{-2}$ |
| 2 | 0.0252 | 0.0125 | $5.64 \times 10^{-2}$ |
| 3 | 0.0252 | 0.0250 | $1.13 \times 10^{-1}$ |

## CH 223: Lectures and Labs

Lectures: MWF from 9-9:50 AM in AC 1303 (this room)

- Lectures recorded, available soon afterwards
- Lecture notes to print available (under "Problem Sets and Handouts", mhchem.org/223), get CH 223 Companion as soon as possible

Labs (Section 01): Mondays from 1:10-5 PM

- Start in room AC 1303
- Move to AC 2507 ("the lab") around 3 PM
- For first day, bring a printed copy of the "ID of an Unknown Compound" Lab (mhchem.org/223), a pair of safety glasses (Dollar store ok) and your calculator

## Properties of an Equilibrium

Equilibrium systems are

- DYNAMIC (in constant motion)
- REVERSIBLE
- can be approached from either direction

Pink to blue
$\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{Cl}_{2}+2 \mathrm{Cl}^{-1} \ldots \mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}_{4}{ }^{2-}+4 \mathrm{H}_{2} \mathrm{O}$
Blue to pink
$\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{Cl}_{4}^{2-}+4 \mathrm{H}_{2} \mathrm{O}-->\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6} \mathrm{Cl}_{2}+2 \mathrm{Cl}^{-1}$

## MAR

MAR

Chemical Equilibrium $\mathrm{Fe}^{3+}+\mathbf{S C N} \rightleftharpoons \mathrm{FeSCN}^{2+}$

## Examples of Chemical Equilibria

Formation of stalactites and stalagmites:
$\mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq})+\mathrm{CO}_{2}(\mathrm{~g}) \rightleftharpoons$ $\mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{HCO}_{3}-(\mathrm{aq})$

Phase changes:
$\mathrm{H}_{2} \mathrm{O}(\mathrm{s}) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}$ (liq)

## The Equilibrium Constant: Example

Equilibrium constants, K, come from kinetic rate constants, $k$
Example: For $2 \mathbf{N O}_{\mathbf{2 ( g )}} \rightleftharpoons \mathbf{N}_{\mathbf{2}} \mathbf{O}_{\mathbf{4 ( \mathrm { g } )}}$,

$$
\begin{aligned}
& \text { rate }_{f}=k_{f}\left[\mathrm{NO}_{2}\right]^{2} \\
& \text { rate }_{\mathrm{r}}=\mathrm{k}_{\mathrm{r}}\left[\mathrm{~N}_{2} \mathrm{O}_{4}\right]
\end{aligned}
$$

When rates equal, rate $_{f}=$ rate $_{r}$, and

$$
\begin{aligned}
& k_{f}\left[\mathrm{NO}_{2}\right]^{2}=k_{r}\left[\mathrm{~N}_{2} \mathrm{O}_{4}\right] \\
& {\left[\mathrm{N}_{2} \mathrm{O}_{4}\right] /\left[\mathrm{NO}_{2}\right]^{2}=k_{f} / k_{r}=K \text { (equilibrium) }}
\end{aligned}
$$

## The Equilibrium Constant: Example

## The Equilibrium Constant

For any type of chemical equilibrium of the type

$$
a \mathbf{A}+\mathbf{b} \mathbf{B} \rightleftharpoons \mathbf{c} \mathbf{C}+\mathbf{d} \mathbf{D}
$$

the following is a CONSTANT (at a given $T$ )

If $K$ is known, we can predict concentrations of products or reactants.

The Equilibrium Constant: Example

## Determining K

$2 \mathrm{NOCl}(\mathrm{g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{g})+\mathrm{Cl}_{2}(\mathrm{~g})$
Place 2.00 mol of NOCl is a 1.00 L flask. At equilibrium you find $0.66 \mathrm{~mol} / \mathrm{L}$ of NO. Calculate K.
Solution

| Set of a table of concentrations (ICE) |  |  |  |
| :--- | :--- | :--- | :--- |
|  | $[\mathrm{NOCl}]$ | $[\mathrm{NO}]$ | $\left[\mathrm{Cl}_{2}\right]$ |
| Initial | 2.00 | 0 | 0 |
| Change |  |  |  |
| Equilibrium |  | 0.66 |  |

## Determining K

| $2 \mathrm{NOCl}(\mathrm{g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{g})+\mathrm{Cl}_{2}(\mathrm{~g})$ |  |  |  |
| :---: | :---: | :---: | :---: |
| Place 2.00 mol of NOCl is a 1.00 L flask. At equilibrium you find $0.66 \mathrm{~mol} / \mathrm{L}$ of NO . Calculate K. |  |  |  |
| Solution |  |  |  |
| Set of a table of concentrations (ICE) |  |  |  |
|  | [ NOCl ] | [NO] | $\left[\mathrm{Cl}_{2}\right]$ |
| Initial | 2.00 | 0 | 0 |
| Change | -0.66 | +0.66 | +0.33 |
| Equilibrium | 1.34 | 0.66 | 0.33 |

MAR
How to remember ICE:
-
$\square$ How torer

## Writing and Manipulating K

Expressions

Solids and liquids NEVER appear in equilibrium expressions.

$$
\mathbf{S}(\mathbf{s})+\mathbf{O}_{\mathbf{2}}(\mathbf{g}) \rightleftharpoons \mathbf{S O}_{\mathbf{2}}(\mathbf{g})
$$

$$
K=\frac{\left[\mathrm{SO}_{2}\right]}{\left[\mathrm{O}_{2}\right]}
$$

## Writing and Manipulating K <br> Expressions

Adding equations for reactions

$$
\begin{aligned}
& \mathbf{S}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{SO}_{2}(\mathrm{~g}) \quad \mathrm{K}_{1}=\left[\mathrm{SO}_{2}\right] /\left[\mathrm{O}_{2}\right] \\
& \mathrm{SO}_{2}(\mathrm{~g})+1 / 2 \mathrm{O}_{2}(\mathrm{~g}) \\
& \rightleftharpoons \mathrm{SO}_{3}(\mathrm{~g}) \\
& \mathrm{K}_{2}=\left[\mathrm{SO}_{3}\right] /\left[\mathrm{SO}_{2}\right]\left[\mathrm{O}_{2}\right]^{1 / 2}
\end{aligned}
$$

## NET EQUATION

$$
\mathbf{s}(\mathbf{s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{SO}_{3}(\mathrm{~g})
$$

$$
\mathrm{K}_{\mathrm{net}}=\frac{\left[\mathrm{SO}_{3}\right]}{\left[\mathrm{O}_{2}\right]^{3 / 2}}=\mathrm{K}_{1} \bullet \mathrm{~K}_{2}
$$

## Writing and Manipulating K <br> Expressions

$$
\begin{aligned}
& \text { Changing coefficients } \\
& \begin{aligned}
& \mathbf{S}(\mathbf{s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons \mathbf{s O}_{3}(\mathrm{~g}) \quad \mathrm{K}_{\text {old }}=\frac{\left[\mathrm{SO}_{3}\right]}{\left[\mathrm{O}_{2}\right]^{3 / 2}} \\
& \mathbf{2 S ( s )}+3 \mathbf{O}_{2}(\mathbf{g}) \rightleftharpoons 2 \mathbf{S O}_{3}(\mathrm{~g}) \\
& \mathrm{K}_{\text {new }}=\frac{\left[\mathrm{SO}_{3}\right]^{2}}{\left[\mathrm{O}_{2}\right]^{3}} \\
& \mathrm{~K}_{\text {new }}=\frac{\left[\mathrm{SO}_{3}\right]^{2}}{\left[\mathrm{O}_{2}\right]^{3}}=\left(\mathrm{K}_{\text {old }}\right)^{2}
\end{aligned}
\end{aligned}
$$

## Writing and Manipulating K

 Expressions$$
\begin{aligned}
& \text { Changing direction } \\
& \begin{array}{l}
\mathbf{S ( s )}+\mathbf{O}_{2}(\mathbf{g}) \rightleftharpoons \mathbf{S O}_{2}(\mathbf{g}) \quad K=\frac{\left[\mathrm{SO}_{2}\right]}{\left[\mathrm{O}_{2}\right]} \\
\mathbf{S O}_{2}(\mathbf{g}) \rightleftharpoons \mathbf{S}(\mathbf{s})+\mathbf{O}_{2}(\mathbf{g}) \quad K_{\text {new }}=\frac{\left[\mathrm{O}_{2}\right]}{\left[\mathrm{SO}_{2}\right]} \\
\text { and: } \quad K_{\text {new }}=\frac{\left[\mathrm{O}_{2}\right]}{\left[\mathrm{SO}_{2}\right]}=\frac{1}{\mathrm{~K}_{\text {old }}}
\end{array}
\end{aligned}
$$

## Converting $\mathbf{K}_{\mathbf{c}}$ Into $\mathbf{K}_{\mathbf{p}}$

$$
K_{p}=K_{c}(R T)^{\Delta n}
$$

$$
\mathrm{T}=\text { Temperature (K) }
$$

$R=0.082057 \mathrm{~L} \mathrm{~atm} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
$\Delta \mathrm{n}=$ change in moles of gas
Example:
$\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$
$\Delta n=2-4=-2$
see: Types of Equilibrium Constants

## The Meaning of K

Can tell if a reaction is product-favored or reactant-favored.
For: $\mathbf{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$

$$
K_{c}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}=3.5 \times 10^{8}
$$

Conc. of products is much greater than that of reactants at equilibrium.
The reaction is strongly productfavored.

## Kp Expressions

We have been writing $K$ in terms of $M$ ( $\mathrm{mol} / \mathrm{L}$ ), designated by $\mathbf{K}_{\mathbf{c}}$
Equilibrium constants expressed in terms of gases designated $\mathbf{K}_{\mathbf{p}}$ where all pressures in atm ( $760 \mathrm{~mm} \mathrm{Hg}=1 \mathrm{~atm}$ )
For: $\mathbf{N}_{\mathbf{2}}(\mathrm{g})+\mathbf{3} \mathbf{H}_{\mathbf{2}}(\mathrm{g}) \rightleftharpoons \mathbf{2} \mathbf{N H}_{\mathbf{3}}(\mathbf{g})$

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}} \quad \mathrm{~K}_{\mathrm{p}}=\frac{\mathrm{P}_{N H_{3}}^{2}}{\mathrm{P}_{\mathrm{N}_{2}} \mathrm{P}_{\mathrm{H}_{2}}^{3}}
$$

## The Meaning of K

MAR

## The Meaning of K

For: $\mathbf{A g C l}(\mathrm{s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}(\mathrm{aq})$
$K_{c}=\left[\mathrm{Ag}^{+}\right][\mathrm{Cl}]=1.8 \times 10^{-5}$
Conc. of products is much less than that of reactants at equilibrium.

The reaction is strongly reactant-favored.

The reverse reaction $\mathbf{A g}^{+}(\mathrm{aq})+\mathbf{C l}(\mathrm{aq}) \rightleftharpoons \mathbf{A g C l}(\mathrm{s})$ is product-favored,

Product- or Reactant Favored

Product-favored $K>1$

Reactant-favored K < 1

The Reaction Quotient, Q

## The Reaction Quotient, Q

All reacting chemical systems can be characterized by their REACTION QUOTIENT, Q.
For: $\quad \mathbf{a} \mathbf{A}+\mathbf{b} \mathbf{B} \rightleftharpoons \mathbf{c} \mathbf{C}+\mathbf{d} \mathrm{D}$
Under Any Reaction Conditions

$$
\text { Reaction quotient }=Q=\frac{\begin{array}{l}
\text { Product concentrations }
\end{array}}{[\mathrm{C}]^{c}[\mathrm{D}]^{d}}{ }^{[\mathrm{A}]^{a}[\mathrm{~B}]^{b}}
$$

If $Q=K$, then system is at equilibrium. If $Q \neq K$, then system is not at equilibrium

The Reaction Quotient, Q

## Comparing $Q$ and $K$ :

$Q<K$, reaction shifts to the products (right) $Q>K$, reaction shifts to the reactants (left) $Q=K$, reaction is at equilibrium

The Reaction Quotient, Q
We can use $Q$ to tell if a reaction is at equilibrium. If not at equilibrium, we can predict which way the reaction will move to approach equilibrium.

H

$$
K=\frac{[\text { iso }]}{[n]}=2.50
$$

## The Reaction Quotient, Q

$$
\begin{aligned}
& Q=\frac{\text { conc. of iso }}{\text { conc. of } n}=\frac{0.35}{0.15}=2.3
\end{aligned}
$$

## Typical Calculations

$$
\begin{aligned}
& \mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathrm{I}_{\mathbf{2}}(\mathrm{g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}) \\
& K_{c}=\frac{[\mathrm{HI}]^{2}}{\left[\mathrm{H}_{2}\right]\left[\mathrm{I}_{2}\right]}=55.3
\end{aligned}
$$

Place 1.00 mol each of $\mathrm{H}_{2}$ and $\mathrm{I}_{2}$ in a 1.00 L flask. Calc. equilibrium concentrations.

$$
\mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathrm{I}_{\mathbf{2}}(\mathrm{g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}), \mathrm{K}_{\mathrm{c}}=55.3
$$

Step 2. Put equilibrium concentrations into $\mathrm{K}_{\mathrm{c}}$ expression.

$$
K_{c}=\frac{[2 \mathrm{x}]^{2}}{[1.00-\mathrm{x}][1.00-\mathrm{x}]}=55.3
$$

$$
\mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathrm{I}_{\mathbf{2}}(\mathrm{g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}), \mathrm{K}_{\mathrm{c}}=55.3
$$

## Step 1. Set up ICE table to define

 EQUILIBRIUM concentrations.|  | $\left[\mathrm{H}_{2}\right]$ | $\left[\mathrm{I}_{2}\right]$ | $[\mathrm{HI}]$ |
| :--- | :--- | :--- | :--- |
| Initial | 1.00 | 1.00 | 0 |
| Change | $-x$ | $-x$ | $+2 x$ |
| Equilib | $1.00-x$ | $1.00-x$ | $2 x$ |

where $x$ is defined as am't of $H_{2}$ and $I_{2}$ consumed on approaching equilibrium.

Nitrogen Dioxide Equilibrium $\mathbf{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})$ $K_{c}=\frac{\left[\mathrm{NO}_{2}\right]^{2}}{\left[\mathrm{~N}_{2} \mathrm{O}_{4}\right]}=0.0059$ at 298 K
If initial concentration of $\mathrm{N}_{2} \mathrm{O}_{4}$ is 0.50 M , what are the equilibrium concentrations?
Step 1. Set up an equilibrium table

| $\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]$ | $\left[\mathrm{NO}_{2}\right]$ |
| :--- | :--- |
| 0.50 | 0 |
| -x | +2 x |
| $0.50-\mathrm{x}$ | 2 x |

Nitrogen Dioxide Equilibrium

$$
\mathbf{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})
$$

Solve the quadratic equation for $x$.

$$
\begin{aligned}
& \left.\begin{array}{l}
a x^{2}+b x+c=0 \\
a=4 \quad b=0.0059 \quad c=-0.0029 \\
x
\end{array}\right) \\
& x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a} \\
& x=-0.00074 \pm 1 / 8(0.046)^{1 / 2}=-0.00074 \pm 0.027
\end{aligned}
$$

## Le Chatelier's Principle

Temperature, changes in volume, changes in pressure and changes in concentration affect equilibria.
The outcome is governed by LE CHATELIER'S PRINCIPLE
"...if a system at equilibrium is disturbed, the system tends to shift its equilibrium position to counter the effect of the disturbance."
maR

## Temperature effects change the numeric value of $K$

$$
\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightleftharpoons \mathrm{CO}_{2}(\mathrm{aq})+\text { heat }
$$

Decrease T. What happens to equilibrium
position? To value of $K$ ?
$\mathrm{K}=\left[\mathrm{CO}_{2}\right] / \mathrm{P}\left(\mathrm{CO}_{2}\right)$
K increases as T goes down because
[ $\mathrm{CO}_{2}$ ] increases and $\mathrm{P}\left(\mathrm{CO}_{2}\right)$ decreases.
Increase T. Now what?
Equilibrium shifts left and $\mathbf{K}$ decreases. see: Le Chatelier's Guide

MAR

## Nitrogen Dioxide Equilibrium <br> $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})$

Step 2. Substitute into $\mathrm{K}_{\mathrm{c}}$ expression and solve.

$$
K_{c}=0.0059=\frac{\left[\mathrm{NO}_{2}\right]^{2}}{\left[\mathrm{~N}_{2} \mathrm{O}_{4}\right]}=\frac{(2 \mathrm{x})^{2}}{(0.50-\mathrm{x})}
$$

Rearrange: $\quad 0.0059(0.50-x)=4 x^{2}$
$0.0029-0.0059 \mathrm{x}=4 \mathrm{x}^{2}$
$4 x^{2}+0.0059 x-0.0029=0$
This is a QUADRATIC EQUATION
$a x^{2}+b x+c=0$
$a=4 \quad b=0.0059 \quad c=-0.0029$
CH 223: report both values of $x$ when

$$
\begin{aligned}
& \begin{array}{c}
\text { Nitrogen Dioxide Equilibrium } \\
\mathbf{N}_{\mathbf{2}} \mathbf{O}_{\mathbf{4}}(\mathbf{g}) \stackrel{2}{\mathrm{NO}_{\mathbf{2}}(\mathbf{g})} \\
x=\frac{-0.0059 \pm \sqrt{(0.0059)^{2}-4(4)(-0.0029)}}{2(4)} \\
\mathbf{x}=--0.00074 \pm 1 / 8(0.046)^{1 / 2}=-0.00074 \pm 0.027 \\
\mathbf{x}=0.026 \text { or }-0.028 \\
\text { But a negative value is not reasonable. }
\end{array} .
\end{aligned}
$$

Conclusion: $\mathbf{x}=0.026$
$\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.50-\mathrm{x}=0.47 \mathrm{M}$
$\left[\mathrm{NO}_{2}\right]=2 \mathrm{x}=0.052 \mathrm{M}$
CH 223: report both values of $x$ when

EQUILIBRIUM AND EXTERNAL EFFECTS
Concentration changes ---> no change in K - only the position of equilibrium changes.
We can use the "water U-tube" to demonstrate this phenomena (and connect to Haber-Frisch)

## Haber-Frisch reaction:

Adding a "reactant" to a chemical system.

> Haber-Frisch reaction: adding $\mathrm{N}_{2}$ or $\mathrm{H}_{2}$,
> reaction moves to right $\quad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$

## Le Chatelier's Principle

Adding a "product" to a chemical system.

$$
\begin{aligned}
& \text { Haber-Frisch reaction: adding } \mathrm{NH}_{3} \\
& \text { reaction moves to left } \\
& \qquad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})
\end{aligned}
$$ will shift to the $\qquad$ .

## Le Chatelier's Principle

Removing a "product" from a chemical system.
Haber-Frisch reaction: removing $\mathrm{NH}_{3}$, reaction moves to right

## Butane $\rightleftharpoons$ Isobutane

Assume you are at equilibrium with [iso] $=1.25$ M and [butane] $=0.50 \mathrm{M}$. Now add 1.50 M butane. When the system comes to equilibrium again, what are [iso] and [butane]? $\mathrm{K}=\mathbf{2 . 5 0}$

## Butane $\rightleftharpoons$ Isobutane

You are at equilibrium with [iso] $=1.25 \mathrm{M}$ and [butane] $=0.50 \mathrm{M}$. Now add 1.50 M butane.
$Q$ is less than $K$, so equilibrium shifts right away from butane and toward isobutane. Set up concentration (ICE) table

|  | [butane] | [isobutane] |
| :--- | :--- | :--- |
| Initial | $0.50+1.50$ | 1.25 |
| Change | -x | +x |
| Equilibrium | $2.00-\mathrm{x}$ | $1.25+\mathrm{x}$ |

## Butane $\rightleftharpoons$ Isobutane

Assume you are at equilibrium with [iso] $=1.25 \mathrm{M}$ and [butane] $=0.50 \mathrm{M}$. Now add 1.50 M butane. When the system comes to equilibrium again, what are [iso] and [butane] ? $\mathrm{K}=2.50$

## Solution

Calculate $\mathbf{Q}$ immediately after adding more butane and compare with K .

$$
\mathrm{Q}=\frac{\text { [isobutane }]}{[\text { butane }]}=\frac{1.25}{0.50+1.50}=0.625
$$

$Q$ is LESS THAN $K$. Therefore, the reaction Solution

MAR

Equilibrium

## Butane $\rightleftharpoons$ Isobutane

You are at equilibrium with [iso] $=1.25 \mathrm{M}$ and [butane] = 0.50 M . Now add 1.50 M butane. Solution
$K=2.50=\frac{[\text { [isobutane }]}{[\text { butane }]}=\frac{1.25+\mathrm{x}}{2.00-\mathrm{x}}$
$\mathrm{x}=1.07 \mathrm{M}$
At the new equilibrium position,
[butane] = 0.93 M and [isobutane] $=2.32 \mathrm{M}$
Equilibrium has shifted toward isobutane.
Le Chatelier's Principle -

| Change T |
| :--- |
| - changes the value of K |
| - changes observed in $\mathrm{P}, \mathrm{V}$ or concentrations at |
| equilibrium |

| Add or take away reactant or product |
| :--- |

End of Chapter Problems: Test Yourself

1. Write an equilibrium constant expression for the following reaction: $\mathrm{C}(\mathrm{s})+$ $\mathrm{CO}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{CO}(\mathrm{g})$
2. $\mathrm{K}=5.6 \times 10^{-12}$ at 500 K for the dissociation of iodine molecules to iodine atoms: $\mathrm{I}_{\mathbf{2}}(\mathrm{g}) \rightleftarrows \mathbf{2} \mathbf{I}(\mathrm{g})$ A mixture has $\left[\mathrm{I}_{2}\right]=0.020 \mathrm{~mol} / \mathrm{L}$ and $[\mathrm{l}]=2.0 \times 10^{-8} \mathrm{~mol}$ L . Is the reaction at equilibrium (at 500 K )? If not, which way must the reaction proceed to reach equilibrium?
3. The reaction: $\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftarrows \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})$ was examined at $250^{\circ} \mathrm{C}$. At equilibrium, $\left[\mathrm{PCl}_{5}\right]=4.2 \times 10^{-5} \mathrm{~mol} / \mathrm{L},\left[\mathrm{PCl}_{3}\right]=1.3 \times 10^{-2} \mathrm{~mol} / \mathrm{L}$, and $\left[\mathrm{Cl}_{2}\right]=3.9$ $\times 10^{-3} \mathrm{~mol} / \mathrm{L}$. Calculate K for the reaction.
4. The equilibrium constant for the dissociation of iodine molecules to iodine atoms: $\mathbf{l}_{\mathbf{2}}(\mathbf{g}) \rightleftarrows \mathbf{2} \mathbf{I}(\mathrm{g})$ is $3.76 \times 10^{-3}$ at 1000 K . Suppose $0.105 \mathrm{~mol}^{\text {of }} \mathrm{l}_{2}$ is placed in a 12.3 L flask at 1000 K . What are the concentrations of $\mathrm{I}_{2}$ and I when the system comes to equilibrium?
5. Dinitrogen trioxide decomposes to NO and $\mathrm{NO}_{2}$ in an endothermic process $(\Delta \mathrm{H}=40.5 \mathrm{~kJ} / \mathrm{mol}): \mathrm{N}_{2} \mathrm{O}_{3}(\mathrm{~g}) \rightleftarrows \mathrm{NO}(\mathrm{g})+\mathrm{NO}_{2}(\mathrm{~g})$ Predict the effect of the following changes on the position of the equilibrium (left, right, or no change): a. adding more $\mathrm{N}_{2} \mathrm{O}_{3}(\mathrm{~g})$
c. increasing the volume of the reaction flask
c. increasing the volume of the reaction flask d. lowering the temperature

Strong and Weak Acids/Bases
$\mathrm{HNO}_{3}, \mathrm{HCl}, \mathrm{HBr}, \mathrm{HI}$ and $\mathrm{HClO}_{4}$ are among the few known strong monoprotic acids.

## Strong and Weak Acids/Bases

Strong Base: 100\% dissociated in water.
$\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{OH} \cdot(\mathrm{aq})$
Other strong monobasic bases: KOH, LiOH

$\mathrm{Ca}(\mathrm{OH})_{2}$ is a strong dibasic system:
CaO (lime) $+\mathrm{H}_{2} \mathrm{O}$-->
$\mathrm{Ca}(\mathrm{OH})_{2}$ (slaked lime)

Memorize the three strong monobasic bases!

Strong and Weak Acids/Bases
Generally divide acids and bases into STRONG or WEAK categories.
STRONG ACID: $\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightarrow$ $\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{NO}_{3}^{-}(\mathrm{aq})$
$\mathrm{HNO}_{3}$ is about $100 \%$ dissociated in water. Acids create hydronium when they react with water.

## Strong and Weak Acids/Bases

Weak acids are much less than 100\% ionized in water.

One of the best known is acetic acid = $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}=\mathrm{HOAc}$
$\mathrm{HOAc}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightleftharpoons$ OAc-(aq) $+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$

OAc- $=\mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-}=$acetate ion

## Strong and Weak Acids/Bases

Weak base: less than 100\% ionized in water

One of the best known weak bases is ammonia, $\mathrm{NH}_{3}$
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})$

$H-\ddot{0}: ~$
0

## ACID-BASE THEORIES

The most general theory for common aqueous acids and bases is the BRØNSTED LOWRY theory
ACIDS DONATE H+ IONS BASES ACCEPT H+ IONS

See Brønsted Acids and Bases Handout

MAR

## ACID-BASE THEORIES

$\mathrm{NH}_{3}$ is a BASE in water - and water is itself an ACID
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
Base

$\mathrm{NH}_{3} / \mathrm{NH}_{4}{ }^{+}$is a conjugate pair - related by the gain or loss of $\mathrm{H}^{+}$
Every acid has a conjugate base and vice-versa.

## MORE ABOUT WATER

$\mathrm{H}_{2} \mathrm{O}$ can function as both an ACID and a BASE.

Pure water undergoes AUTOIONIZATION

## MORE ABOUT WATER

$\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.00 \times 10^{-14}$ at $25^{\circ} \mathrm{C}$
In a neutral solution $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[\mathrm{OH}]$
so $\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}=[\mathrm{OH}]^{2}$
and so $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{-}\right]=\sqrt{ } \mathrm{K}_{\mathrm{w}}=1.00 \times 10^{-7} \mathrm{M}$

## Calculating $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$\& $[\mathrm{OH}-]$

You add 0.0010 mol of NaOH to 1.0 L of pure water. Calculate $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right.$] and $\left[\mathrm{OH}^{-}\right]$.
Solution
$2 \mathrm{H}_{2} \mathrm{O}$ (liq) $\rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
Le Chatelier predicts equilibrium shifts to the
$\qquad$ _.
[ $\mathrm{H}_{3} \mathrm{O}^{+}$] < 10-7 at equilibrium.
Set up an ICE concentration table.

## Calculating $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$\& $\left[\mathrm{OH}^{-}\right]$

You add 0.0010 mol of NaOH to 1.0 L of pure water. Calculate $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right.$] and [ $\mathrm{OH}^{-}$].

## Solution

$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\mathrm{K}_{\mathrm{w}} / 0.0010=1.0 \times 10^{-11} \mathrm{M}$
$\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-3} \mathrm{M}$
This solution is $\qquad$
because
$\left[\mathrm{OH}^{-}\right]>\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$

## $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right],\left[\mathrm{OH}^{-}\right]$and pH

What is the pH of the 0.0010 M NaOH solution?
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.0 \times 10^{-11} \mathrm{M}$
$\mathrm{pH}=-\log \left(1.0 \times 10^{-11}\right)=11.00$

## Calculating $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$\& $\left[\mathrm{OH}^{-}\right]$

You add 0.0010 mol of NaOH to 1.0 L of pure water. Calculate $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$and $\left[\mathrm{OH}^{-}\right]$.
Solution

| $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{liq})$ | $\rightleftharpoons$ | $\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})$ |
| :--- | :--- | :--- | :--- |
| initial | 0 | 0.0010 |
| change | $+x$ | $+x$ |
| equilib | $x$ | $0.0010+x$ |

$K_{w}=(x)(0.0010+x)$
Because $x \ll 0.0010 \mathrm{M}$, assume $[\mathrm{OH}-]=0.0010 \mathrm{M}$ $\mathrm{K}_{\mathrm{w}}=(\mathrm{x})(0.0010+\mathrm{x}) \approx(\mathrm{x})(\mathbf{0 . 0 0 1 0})=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right](0.0010)$ $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\mathrm{K}_{\mathrm{w}} / 0.0010=1.0 \times 10^{-11} \mathrm{M}$

## logarithms and sig figs

Logarithms are exponents with special sig figs rules. General rule:
log of experimentally measured number with $N$ sig figs give numbers with $\boldsymbol{N}$ decimal places after the decimal (digit before decimal only indicates magnitude)
Examples:
$\log 3.07^{*} 10^{-3}=-2.513(3$ sigs, 3 places after decimal)

- $\log 1.1^{* 1} 0^{-8}=7.96$ (2 sigs, 2 places after decimal) $10^{-3.12}=7.6 * 10^{-4}$ (2 places after decimal, 2 sigs)

## Other pX Scales

In general $\quad \mathbf{p X}=-\log \mathbf{X}$
and: $\quad \mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}$ and so: $\quad \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$
$\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.00 \times 10^{-14}$ at $25^{\circ} \mathrm{C}$
Take the negative log of both sides

$$
\begin{aligned}
-\log (10-14) & =-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]+(-\log [\mathrm{OH}-]) \\
14 & =\mathrm{pH}+\mathrm{pOH} \\
\text { also: } 14 & =\mathrm{pK}_{\mathrm{a}}+\mathrm{pK}_{\mathrm{b}}
\end{aligned}
$$

## Equilibria Considerations Involving <br> Weak Acids and Bases

Acid
acetic, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$
ammonium, $\mathrm{NH}_{4}{ }^{+}$
bicarbonate, $\mathrm{HCO}_{3}{ }^{-}$

Conjugate Base
$\mathrm{CH}_{3} \mathrm{CO}_{2}$-, acetate
$\mathrm{NH}_{3}$, ammonia
$\mathrm{CO}_{3}{ }^{2-}$, carbonate

A weak acid (or base) is one that ionizes to a VERY small extent (< $5 \%$ ).

## pH of Common Substances

Figure 5.17 pH values of some common substances. Here the "bar" is colored red at one end and blue at the other. These are the colors of litmus paper, commonly used in the laboratory to decide if a solution is acidic (litmus is red) or basic (litmus is blue). (Charres $D$. Winters)

MAR

## Equilibria Involving Weak Acids and Bases

Consider acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ (HOAc)
$\underset{\text { Acid }}{\mathrm{HOAc}}+\mathrm{H}_{2} \mathrm{O} \quad \rightleftharpoons \quad \mathrm{H}_{3} \mathrm{O}^{+}+\underset{\text { Conj. base }}{\mathrm{OAc}}$

$$
K_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]}=1.8 \times 10^{-5}
$$

( K is designated $\mathrm{K}_{\mathrm{a}}$ for ACID)
Because $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$and [OAc-] are SMALL, $\mathrm{K}_{\mathrm{a}} \ll 1$.

| Equilibrium Constants |
| :---: |
| for Weak Acids $\left(\mathbf{K}_{\mathbf{a}}\right)$ |

$\mathrm{HA}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{A}^{-}(\mathrm{aq})$
$K_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}$

Weak acids have $\mathrm{K}_{\mathrm{a}}<1$
Leads to small $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$and a pH of 2-7

MAR

## Equilibrium Constants

for Weak Acids and Bases

Important relations: $K_{a}{ }^{\star} K_{b}=K_{w}$ and

$$
p K_{a}+p K_{b}=14
$$

## $K$ and Acid-Base Reactions

| ACIDS | CONJUGATE BASES |
| :---: | :---: |
| STRONG | weak |
| $\uparrow$ | $\downarrow$ |
| weak | STRONG |

In general, Reactions always go from the stronger $A-B$ pair (larger $K$ ) to the weaker $A-B$ pair (smaller $K$ ).

## Ionization Constants for Acids/Bases

## $K$ and Acid-Base Reactions

A strong acid is $\mathbf{1 0 0 \%}$ dissociated.
Therefore, a STRONG ACID - a good $\mathrm{H}^{+}$donormust have a WEAK CONJUGATE BASE - a poor $\mathrm{H}^{+}$acceptor.

$$
\begin{array}{ll}
\mathrm{HNO}_{3}(\mathrm{aq}) & +\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \\
\text { STRONG A base } & \rightleftharpoons \underset{3}{ } \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\underset{\text { acid }}{\mathrm{NO}_{3}-(\mathrm{aq})}
\end{array}
$$

Every A-B reaction has two acids and two bases. Equilibrium always lies toward the weaker pair. Here K is very large... should write:
$\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{NO}_{3}-(\mathrm{aq})$

## $K$ and Acid-Base Reactions

Acetic acid is only $0.42 \%$ ionized when [HOAc] = 1.0 M . It is a WEAK ACID

Because $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$is small, this must mean

1. $\mathrm{H}_{3} \mathrm{O}^{+}$is a stronger acid than HOAc
2. OAc - is a stronger base than $\mathbf{H}_{2} \mathrm{O}$
3. K for this reaction is small

## Types of Acid/Base Reactions

4. Weak acid + weak base (WA + WB) reactions:

|  | ${ }_{1}$ |
| :---: | :---: |
| : F-H | : $\mathrm{N}-\mathrm{H}$ |
| Acid | Base |

Product cation = conjugate acid of weak base.
Product anion = conjugate base of weak acid. pH of solution depends on relative strengths of cation and anion (larger K $\rightarrow$ smaller K).

Types of Acid/Base Reactions

1. Strong acid + Strong base $(S A+S B)$ reactions:
$\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{NaCl}(\mathrm{aq})$
$\mathrm{H}^{+}+\mathrm{Cl}^{+}+\mathrm{Na}^{+}+\mathrm{OH}^{-} \rightleftharpoons \mathrm{H}_{2} \mathrm{O}+\mathrm{Na}^{+}+\mathrm{Cl}^{-}$
Net ionic equation:
$\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}$ (liq)
$K=1 / K_{w}=1 \times 10^{14} \quad$ very product favored $K!$
Mixing equal molar quantities of a strong acid and strong base produces a neutral solution. should write:
$\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{NaCl}(\mathrm{aq})$

## Types of Acid/Base Reactions

3. Weak base + Strong acid (WB + SA) reactions:
$\mathbf{H}_{3} \mathbf{O}^{+}+\mathbf{N H}_{3} \rightleftharpoons \mathbf{H}_{2} \mathbf{O}+\mathbf{N H}_{4}{ }^{+}$
This is the reverse of the reaction of $\mathrm{NH}_{4}{ }^{+}$ (conjugate acid of $\mathrm{NH}_{3}$ ) with $\mathrm{H}_{2} \mathrm{O}$.
$\mathrm{H}_{3} \mathrm{O}^{+}$stronger acid than $\mathrm{NH}_{4}{ }^{+}$
$K=1 / K_{a}=1.8 \times 10^{9} \quad$ very product favored $K!$
Mixing equal molar quantities of a strong acid and weak base produces
the base's conjugate acid. The solution is acidic.
MAR

Types of Acid/Base Reactions:
Summary

Table 17.5 - Characteristics of Acid-Base Reactions

| Type | Example | Net Ionic Equation | Species Present After Equal Molar Amounts Are Mixed; pH |
| :---: | :---: | :---: | :---: |
| Strong acid + strong base | $\mathrm{HCl}+\mathrm{NaOH}$ | $\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftarrows 2 \mathrm{H}_{2} \mathrm{O}(\ell)$ | $\mathrm{Cl}^{-}, \mathrm{Na}^{+}, \mathrm{pH}=7$ |
| Strong acid + weak base | $\mathrm{HCl}+\mathrm{NH}_{3}$ | $\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{NH}_{3}(\mathrm{aq}) \rightleftarrows \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)$ | $\mathrm{Cl}^{-}, \mathrm{NH}_{4}{ }^{+}, \mathrm{pH}<7$ |

0.0001 M

## Equilibria Involving A Weak Acid

Determining the pH of an acetic acid solution

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of $\mathrm{HOAc}, \mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OAc}$, and the pH .
$\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OAc}^{-}$
Step 2. Write $K_{a}$ expression
$K_{a}=1.8 \times 10^{-5}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]}=\frac{\mathrm{x}^{2}}{1.00-\mathrm{x}}$
This is a quadratic equation; solve using the quadratic formula.
... but there's a better way, sometimes!

Equilibria Involving A Weak Acid
You have 1.00 M HOAc. Calc. the equilibrium concs. of HOAc, $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OAc}^{-}$, and the pH .
Step 3. Solve $\mathrm{K}_{\mathrm{a}}$ approximate expression:

$$
\begin{gathered}
K_{a}=1.8 \times 10^{-5}=\frac{\mathrm{x}^{2}}{1.00} \\
\mathbf{x}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[\mathrm{OAC}-]=\left[1.8 \times 10^{-5} \cdot 1.00\right]^{1 / 2} \\
\mathbf{x}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[\mathrm{OAC} \cdot]=4.2 \times 10^{-3} \mathbf{~ M} \\
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log \left(4.2 \times 10^{-3}\right)=\mathbf{2 . 3 7}
\end{gathered}
$$

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of $\mathrm{HOAc}, \mathrm{H}_{3} \mathrm{O}^{+}$, OAc -, and the pH .
Step 1. Define ICE equilibrium using $\mathrm{K}_{\mathrm{a}}$.

| $\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O}$ |  | $\rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OAc}$ |  |
| :--- | :--- | :--- | :--- |
|  | $[\mathrm{HOAc}]$ | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ | $[\mathrm{OAc}-]$ |
|  |  | 0 | 0 |
| initial | 1.00 | 0 | $+x$ |
| change | $-x$ | $+x$ | $x$ |

Note that we neglect $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$from $\mathrm{H}_{2} \mathrm{O}$. $H O A c=$ acetic acid, OAc- = acetate ion

> Equilibria Involving A Weak Acid
> You have 1.00 m HOAc. Calc. the equilibrium concs. of HOAc, $\mathrm{H}_{3} \mathrm{O}^{+}$, OAc , and the pH .
> Step 3. Solve $\mathrm{K}_{\mathrm{a}}$ expression
> $K_{a}=1.8 \times 10^{-5}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]}=\frac{\mathrm{x}^{2}}{1.00-\mathrm{X}}$

First assume $\mathbf{x}$ is very small because $K_{a}$ is so small. If so:

$$
K_{a}=1.8 \times 10^{-5}=\frac{\mathrm{x}^{2}}{1.00}
$$

Therefore,
$\mathrm{x}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[\mathrm{OAc}]=\left[1.8 \times 10^{-5} \cdot 1.00\right]^{1 / 2}=\left[\mathrm{K}_{\mathrm{a}} \cdot \mathrm{C}_{\mathrm{a}}\right]^{1 / 2}$
$C_{a}=$ concentration $(M)$ of acid

## Equilibria Involving A Weak Acid

Consider the approximate expression:
$K_{a}=1.8 \times 10^{-5}=\frac{\mathrm{x}^{2}}{1.00} \quad \mathrm{X}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{K}_{\mathrm{a}} \cdot 1.00\right]^{1 / 2}$
For many weak acids
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=$[conj. base] $=\left[\mathrm{K}_{\mathrm{a}} \cdot \mathrm{C}_{\mathrm{a}}\right]^{1 / 2}$
where $C_{a}=$ initial conc. of acid
Useful Rule of Thumb:
If $100 \cdot \mathrm{~K}_{\mathrm{a}}<\mathrm{C}_{\mathrm{a}}$, then $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{K}_{\mathrm{a}} \cdot \mathrm{C}_{\mathrm{a}}\right]^{1 / 2}$
or $\mathrm{pH}=-\log \left[K_{a} \cdot C_{a}\right]^{1 / 2}$

Equilibria Involving A Weak Acid Calculate the pH of a 0.0010 M solution of formic acid, $\mathrm{HCO}_{2} \mathrm{H}$.

| $\mathrm{HCO}_{2} \mathrm{H}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons$ | $\mathrm{HCO}_{2}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$ |
| :---: | :---: |
| $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-4}$ | $100 * K_{\mathrm{a}}$ is not less |
| than $\mathrm{C}_{\mathrm{a}}!$ |  |

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{K}_{\mathrm{a}} \cdot \mathrm{C}_{\mathrm{a}}\right]^{1 / 2}=4.2 \times 10^{-4} \mathrm{M}, \mathrm{pH}=3.37
$$

Exact Solution
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{HCO}_{2}^{-}\right]=3.4 \times 10^{-4} \mathrm{M}$
$\left[\mathrm{HCO}_{2} \mathrm{H}\right]=0.0010-3.4 \times 10^{-4}=0.0007 \mathrm{M}$
$\mathrm{pH}=3.47$

Equilibria Involving A Weak Base You have $0.010 \mathrm{M} \mathrm{NH}_{3}$. Calculate the pH .

$$
\begin{aligned}
& \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} \\
& \mathrm{K}_{\mathrm{b}}=1.8 \times 10^{-5}
\end{aligned}
$$

Step 1. Define equilibrium concs.

|  | $\left[\mathrm{NH}_{3}\right]$ | $\left[\mathrm{NH}_{4}{ }^{+}\right]$ | $[\mathrm{OH}]$ |
| :--- | :--- | :--- | :--- |
| initial | 0.010 | 0 | 0 |
| change | $-x$ | $+x$ | $+x$ |
| equilib | $0.010-x$ | $x$ | $x$ |

## Equilibria Involving A Weak Base

You have $0.010 \mathrm{M} \mathrm{NH}_{3}$. Calculate the pH .

$$
\begin{aligned}
& \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} \\
& \mathrm{K}_{\mathrm{b}}=1.8 \times 10^{-5} \\
& \text { Step 3. Calculate } \mathrm{pH} \\
& {[\mathrm{OH} \cdot]=4.2 \times 10^{-4} \mathrm{M}} \\
& \text { so } \mathrm{pOH}=-\log [\mathrm{OH}-]=3.37 \\
& \text { Because } \mathrm{pH}+\mathrm{pOH}=14, \\
& \mathrm{pH}=10.63 \\
& \text { or } \mathrm{pH}=14+\log \left[\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}\right]^{1 / 2}=10.63
\end{aligned}
$$

Equilibria Involving A Weak Base You have $0.010 \mathrm{M} \mathrm{NH}_{3}$. Calculate the pH .

$$
\begin{aligned}
& \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}++\mathrm{OH}^{-} \\
& \mathrm{K}_{\mathrm{b}}=1.8 \times 10^{-5}
\end{aligned}
$$

Step 2. Solve the equilibrium expression

$$
K_{b}=1.8 \times 10^{-5}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}=\frac{\mathrm{x}^{2}}{0.010-\mathrm{x}}
$$

Assume x is small $\left(100 \cdot \mathrm{~K}_{\mathrm{b}}<\mathrm{C}_{\mathrm{b}}\right)$, so
$x=\left[\mathrm{OH}^{-}\right]=\left[\mathrm{NH}_{4}{ }^{+}\right]=\left[\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}\right]^{1 / 2}=4.2 \times 10^{-4} \mathrm{M}$ check: $\left[\mathrm{NH}_{3}\right]=0.010-4.2 \times 10^{-4} \approx 0.010 \mathrm{M}$ Valid approximation!

MAR

Overview: Calculating pH of Acids \& Bases
Strong acid: $\mathrm{pH}=-\log \mathrm{C}_{\mathrm{a}}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
Strong base:

$$
\mathrm{pH}=14+\log \mathrm{C}_{\mathrm{b}}=14+\log \left[\mathrm{OH}^{-1}\right]
$$

Weak acid:

$$
\mathbf{p H}=-\log \left[\mathbf{K}_{\mathrm{a}} \cdot \mathbf{C}_{\mathrm{a}}\right]^{1 / 2}\left(100 * K_{a}<C_{a}\right)
$$

Weak base:

$$
\mathrm{pH}=14+\log \left[\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}\right]^{1 / 2}\left(100 * K_{b}<C_{b}\right)
$$

## Acid-Base Properties of Salts

$M X+\mathrm{H}_{2} \mathrm{O} \rightarrow-->$ acidic or basic solution?
Consider $\mathrm{NH}_{4} \mathrm{Cl}$
$\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})--->\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{Cl}(\mathrm{aq})$
(a) Reaction of Cl - with $\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Cl}^{-}+\mathrm{H}_{2} \mathrm{O}--->\mathrm{HCl}+\mathrm{OH}^{-}$
base acid acid base
Cl ion is a VERY weak base because its conjugate acid is strong.
Therefore, $\mathrm{Cl}^{-}--->$neutral solution

## Acid-Base Properties of Salts

## Acid-Base Properties of Salts

Calculate the pH of a 0.10 M solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$. $\mathrm{Na}^{+}+\mathrm{H}_{2} \mathrm{O}--->$ neutral

| $\mathrm{CO}_{3}{ }^{2-}+$ $\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCO}_{3}^{-}$ <br> base acid $\quad+\quad \mathrm{OH}^{-}$ <br>  $\mathrm{K}_{\mathrm{b}}=2.1 \times 10^{-4}$ <br> base  |  |
| :--- | :--- |
| Step 2. | Solve the equilibrium expression |

$$
\begin{aligned}
& \quad K_{b}=2.1 \times 10^{-4}=\frac{\left[\mathrm{HCO}_{3}^{-}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{CO}_{3}^{2-}\right]}=\frac{\mathrm{x}^{2}}{0.10-\mathrm{x}} \\
& \text { Assume } \mathbf{0 . 1 0 - \mathbf { x } \approx \mathbf { 0 . 1 0 , } \text { because } 1 0 0 \cdot \mathrm { K } _ { \mathrm { b } } < \mathrm { C } _ { \mathrm { b } }} \\
& \mathbf{x}=\left[\mathrm{HCO}_{3}-\right]=[\mathrm{OH}]=\left[\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}\right]^{1 / 2}=\mathbf{0 . 0 0 4 6} \mathbf{~ M}
\end{aligned}
$$

Acid-Base Properties of Salts
$M X+\mathrm{H}_{2} \mathrm{O}$----> acidic or basic solution?
$\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})$---> $\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{Cl}(\mathrm{aq})$
(b) Reaction of $\mathrm{NH}_{4}+$ with $\mathrm{H}_{2} \mathrm{O}$

acid base base acid
$\mathrm{NH}_{4}{ }^{+}$ion is a moderate acid $\left(\mathrm{K}_{\mathrm{a}}=5.6 \times 10^{-10}\right)$ because its conjugate base is weak.
Therefore, $\mathrm{NH}_{4}{ }^{+}$----> acidic solution

## Acid-Base Properties of Salts

## Calculate the pH of a 0.10 M solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$.

$\mathrm{Na}^{+}+\mathrm{H}_{2} \mathrm{O}--->$ neutral

| $\mathrm{CO}_{3}{ }^{2-}+$ |
| :--- | :--- |
| base | | acid |
| :--- |
| $\mathrm{H}_{2} \mathrm{O}$ |
| $\mathrm{K}_{\mathrm{b}}=2.1 \times 10^{-4}$ | $\mathrm{HCO}_{3}{ }^{\text {acid }}+\mathrm{OH}^{-}$

Step 1. Set up ICE concentration table

|  | $\left[\mathrm{CO}_{3}{ }^{2}\right]$ | $\left[\mathrm{HCO}_{3}{ }^{-}\right]$ | $[\mathrm{OH}]$ |
| :--- | :--- | :--- | :--- |
| initial | 0.10 | 0 | 0 |
| change | $-x$ | $+x$ | $+x$ |
| equilib | $0.10-x$ | $x$ | $x$ |

## Acid-Base Properties of Salts

Calculate the pH of a 0.10 M solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$. $\mathrm{Na}^{+}+\mathrm{H}_{2} \mathrm{O}$---> neutral
$\underbrace{\mathrm{CO}_{3}{ }^{2-}+}_{\text {base }} \underset{\substack{\text { acid } \\ \mathrm{K}_{\mathrm{b}}=2.1 \times 10^{-4}} \underset{\text { acid }}{\mathrm{HCO}_{3}{ }^{-}}+\quad+\quad \mathrm{OH}^{-}}{\text {base }}$

Step 3. Calculate the pH
[ OH ] $=0.0046 \mathrm{M}$
$\mathrm{pOH}=-\log [\mathrm{OH}]=2.34$
$\mathrm{pH}+\mathrm{pOH}=14$,
so $\mathrm{pH}=11.66$, and the solution is $\qquad$ -

## Lewis Acids \& Bases

Lewis Acids \& Bases

New bond formed using electron pair from the Lewis base.
Coordinate covalent bond
Notice geometry change on reaction.

Lewis Acids \& Bases
The combination of metal ions (Lewis acids) with Lewis bases such as $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{NH}_{3}$ COMPLEX IONS

## All metal ions form

 complex ions with water and are of the type $\left[\mathrm{M}\left(\mathrm{H}_{2} \mathrm{O}\right)_{x}\right]^{n+}$ where $\mathrm{x}=4$ and 6.
$\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$

## Lewis Acids \& Bases

Add $\mathrm{NH}_{3}$ to light blue $\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}----->$ light blue $\mathrm{Cu}(\mathrm{OH})_{2}$ and then deep blue $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$

MAR

## Lewis Acids \& Bases

Lewis acid \& base theory explains
AMPHOTERIC nature of some metal hydroxides.
$\mathrm{Al}(\mathrm{OH})_{3}(\mathrm{~s})+3 \mathrm{H}^{+}-->\mathrm{Al}^{3+}+3 \mathrm{H}_{2} \mathrm{O}$
Here $\mathrm{Al}(\mathrm{OH})_{3}$ is a Brønsted base.
$\mathrm{Al}(\mathrm{OH})_{3}(\mathrm{~s})+\mathrm{OH}^{-}--\mathrm{Al}(\mathrm{OH})_{4}{ }^{-}$
Here $\mathrm{Al}(\mathrm{OH})_{3}$ is a Lewis acid.

$$
\mathbf{A l}^{3+} \longleftarrow: \bigoplus_{\bullet \bullet}^{0}-\mathbf{H}^{-}
$$

Many complex ions are very stable.

$$
\mathrm{Cu}^{2+}+4 \mathrm{NH}_{3} \rightleftharpoons\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}
$$

$K$ for the reaction is called

$$
\mathbf{K}_{\text {formation }}
$$

or a "formation constant"
Here $K_{f}=6.8 \times 10^{12}$. Reaction is strongly product-favored.

$$
\mathrm{K}_{\mathrm{f}}=\frac{\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}}{\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{NH}_{3}\right]^{4}}
$$

## Lewis Acids \& Bases

Formation of complex ions explains why you can dissolve a precipitate by forming a complex ion.
$\mathbf{A g C l}(\mathrm{s})+2 \mathbf{N H}_{3} \rightleftharpoons$
$\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}+\mathrm{Cl}^{-}$

MAR

## Lewis Acids \& Bases

Formation of complex ions explains why you can dissolve a precipitate by forming a complex ion.

$$
\begin{array}{ll}
\mathrm{AgCl}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}+\mathrm{Cl}^{-} & \mathrm{K}_{\text {sp }}=1.8 \times 10^{-10} \\
\mathrm{Ag}^{+}+2 \mathrm{NH}_{3} \rightleftharpoons \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+} & \mathrm{K}_{\text {form }}=1.6 \times 10^{7}
\end{array}
$$

$\mathrm{AgCl}(\mathrm{s})+2 \mathrm{NH}_{3} \rightleftharpoons \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}+\mathrm{Cl}^{-}$

$$
\mathrm{K}_{\text {net }}=\mathrm{K}_{\mathrm{sp}} \cdot \mathrm{~K}_{\text {form }}=2.9 \times 10^{-3}
$$

[^5]

## Titrations

In a titration a known concentration of base (or acid) is slowly added to a solution of acid (or base)

A pH meter or indicators are used to determine when the solution has reached the equivalence point (where moles of acid = moles of base)

Goal: to determine experimentally or calculate the pH at any point in a titration

Adding NaOH from the buret to acetic acid: Initially the pH increases very slowly, then rises dramatically at equivalence point pH rises, then levels off as equivalence point passed

## Acid-Base Titrations

Notice how [HOAc] diminishes with NaOH , but [OAc-] increases with NaOH
Important to consider conjugates in titrations where weak acids or bases dominate
But first, buffers and the common ion effect

## The Common Ion Effect

A special form of Le Chatelier's Principle..
QUESTION: What is the effect on the pH of adding $\mathrm{NH}_{4} \mathrm{Cl}$ to $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})$
Here we are adding an ion COMMON to the equilibrium with $\mathrm{NH}_{3}$ (i.e. $\mathrm{NH}_{4}{ }^{+}$)
Le Chatelier predicts that the equilibrium will shift to the $\qquad$ —.
The pH will go $\qquad$ -
After all, $\mathrm{NH}_{4}{ }^{+}$is an acid!

## The Common Ion Effect

A special form of Le Chatelier's Principle...
QUESTION: What is the effect on the pH of adding $\mathrm{NH}_{4} \mathrm{Cl}$ to $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})$
Let us first calculate the $\mathbf{p H}$ of a $\mathbf{0 . 2 5} \mathbf{~ M}$ $\mathrm{NH}_{3}$ solution.

|  | $\left[\mathrm{NH}_{3}\right]$ | $\left[\mathrm{NH}_{4}{ }^{+}\right]$ | $[\mathrm{OH}-]$ |
| :--- | :--- | :--- | :--- |
| initial | 0.25 | 0 | 0 |
| change | -x | +x | +x |
| equilib | $0.25-\mathrm{x}$ | x | x |

## The Common Ion Effect

A special form of Le Chatelier's Principle...
QUESTION: What is the effect on the pH of adding $\mathrm{NH}_{4} \mathrm{Cl}$ to $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?

$$
\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})
$$

$$
K_{b}=1.8 \times 10^{-5}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}=\frac{\mathrm{x}^{2}}{0.25-\mathrm{x}}
$$

$$
\text { Assuming } x \text { is } \ll 0.25 \text {, we have }
$$

$$
\left[\mathrm{OH}^{-}\right]=x=\left[\mathrm{K}_{\mathrm{b}}(0.25)\right]^{1 / 2}=0.0021 \mathrm{M}
$$

$$
\text { This gives } \mathrm{pOH}=2.67
$$

$$
\text { and so } \mathrm{pH}=14.00-2.67=11.33
$$

$$
\text { or: } \mathrm{pH}=14+\log \left[\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}\right]^{1 / 2}=11.33
$$

## The Common Ion Effect

A special form of Le Chatelier's Principle...
Problem: What is the pH of a solution with $0.10 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}(\mathrm{aq})$
$K_{b}=1.8 \times 10^{-5}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}=\frac{\mathrm{x}(0.10+\mathrm{x})}{0.25-\mathrm{x}}$
Because equilibrium shifts left, $\mathbf{x}$ is MUCH less than 0.0021 M , the value without $\mathrm{NH}_{4} \mathrm{Cl}$.

## Buffer Solutions

The function of a buffer is to resist changes in the pH of a solution.
Buffers invoke a special case of the common ion effect.
Buffer Composition:

| Weak Acid | + | Conj. Base |
| :--- | :--- | :--- |
| HOAc | + | OAc- |
| $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}$ | + | $\mathrm{HPO}_{4}{ }^{2-}$ |
| Weak Base | + | Conj. Acid |
| $\mathrm{NH}_{3}$ | + | $\mathrm{NH}_{4}{ }^{+}$ |

## The Common Ion Effect

A special form of Le Chatelier's Principle...
Problem: What is the pH of a solution with $0.10 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq})$
We expect that the pH will decline on adding $\mathrm{NH}_{4} \mathrm{Cl}$. Let's test that!

|  | $\left[\mathrm{NH}_{3}\right]$ | $\left[\mathrm{NH}_{4}{ }^{+}\right]$ | $[\mathrm{OH}-]$ |
| :--- | :--- | :--- | :--- |
| initial | 0.25 | 0.10 | 0 |
| change | $-x$ | $+x$ | $+x$ |
| equilib | $0.25-x$ | $0.10+x$ | $x$ |

## The Common Ion Effect

A special form of Le Chatelier's Principle...
Problem: What is the pH of a solution with $0.10 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and $0.25 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ ?
$\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{OH} \cdot(\mathrm{aq})$
$K_{b}=1.8 \times 10^{-5}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}=\frac{\mathrm{x}(0.10+\mathrm{x})}{0.25-\mathrm{x}}$
$[\mathrm{OH}-]=x=(0.25 / 0.10) \mathrm{K}_{\mathrm{b}}=4.5 \times 10-5 \mathrm{M}$
This gives $\mathrm{pOH}=4.35$ and $\mathrm{pH}=9.65$
pH drops from 11.33 to 9.65 on adding a common ion ( $\mathbf{N H}_{4}{ }^{+}$).

MAR

HCl is added to a solution of a weak acid $\mathrm{H}_{2} \mathrm{PO}_{4}$ - and its conjugate base $\mathrm{HPO}_{4}{ }^{2}$.

## Buffers in Our Bodies

The blood pH in our bodies is regulated by a carbonic acid/ hydrogen carbonate ("bicarbonate") buffer system:

$\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3} \rightleftharpoons \mathrm{H}^{+}+\mathrm{HCO}_{3}{ }^{-1}$

Exhaling $\mathrm{CO}_{2}$ raises the pH of our blood!

## Buffer Solutions

Consider HOAc/OAc- to see how buffers work Conjugate base in buffers consumes strong acid!

$$
\begin{gathered}
\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{OAc}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \\
\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}
\end{gathered}
$$

Therefore, the reverse reaction of the weak base with added $\mathrm{H}_{3} \mathrm{O}^{+}$(strong acid) would be:
$\mathrm{OAc}+\mathrm{H}_{3} \mathrm{O}^{+} \rightleftharpoons \mathrm{HOAc}+\mathrm{H}_{\mathbf{2}} \mathrm{O}$
$\mathrm{K}_{\text {reverse }}=1 / \mathrm{K}_{\mathrm{a}}=5.6 \times 10^{4}$
$\mathrm{K}_{\text {reverse }}$ is VERY LARGE, so OAc- completely consumes the $\mathrm{H}_{3} \mathrm{O}^{+}$!

## Buffer Solutions

Consider HOAc/OAc- to see how buffers work
The weak acid in buffers consumes strong base! We know:

$$
\begin{gathered}
\mathrm{OAc}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HOAc}+\mathrm{OH}^{-} \\
\mathrm{K}_{\mathrm{b}}=5.6 \times 10^{-10}
\end{gathered}
$$

Therefore, the reverse reaction of the weak acid with added $\mathrm{OH}^{-}$(strong base) would be:
$\mathrm{HOAc}+\mathrm{OH}^{-} \rightleftharpoons \mathrm{OAc}+\mathrm{H}_{2} \mathrm{O}$
and: $K_{\text {reverse }}=1 / K_{b}=1.8 \times 10^{9}$
$K_{\text {reverse }}$ is VERY large, so HOAc completely consumes the OH !

## Buffer Solutions

MAR

## Buffer Solutions

Problem: What is the pH of a buffer that has [ HOAc ] $=0.700 \mathrm{M}$ and $[\mathrm{OAc}-]=0.600 \mathrm{M}$ ?
$\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{OAc}{ }^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$ $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}$

|  | $[\mathrm{HOAc}]$ | $[\mathrm{OAc}-]$ | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |
| :--- | :--- | :--- | :--- |
| initial | 0.700 | 0.600 | 0 |
| change | $-x$ | $+x$ | $+x$ |
| equilib | $0.700-x$ | $0.600+x$ | $x$ |

## Buffer Solutions

Problem: What is the pH of a buffer that has [ HOAc ] $=0.700 \mathrm{M}$ and $[\mathrm{OAc}-]=0.600 \mathrm{M}$ ?
$\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{OAc}-+\mathrm{H}_{3} \mathrm{O}^{+}$
$K_{a}=1.8 \times 10^{-5}$

| $[\mathrm{HOAc}]$ | $[\mathrm{OAc}-]$ | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |
| :---: | :---: | :---: |
| equilib | $0.700-\mathrm{x}$ | $0.600+x$ | x

Assuming that $x \ll 0.700$ and 0.600 , we have

$$
\begin{aligned}
& K_{a}=1.8 \times 10^{-5}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right](0.600)}{0.700} \\
& {\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.8 \times 10^{-5} *(0.700 / 0.600)=2.1 \times 10^{-5} \text { and } } \\
& \mathrm{pH}=4.68
\end{aligned}
$$

Henderson-Hasselbalch Equation

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{[\text { Acid }]}{[\text { Conj. base }]} \bullet \mathrm{K}_{\mathrm{a}}
$$

Take the negative log of both sides of this equation:

The pH is determined largely by the $\mathrm{pK}_{\mathrm{a}}$ of the acid and then adjusted by the ratio of acid and conjugate base. Important equation!

## Buffer Solutions

Notice that the expression for calculating the $\mathrm{H}^{+}$conc. of the buffer is:
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{\text { Orig. conc. of } \mathrm{HOAc}}{\text { Orig. conc. of } \mathrm{OAc}^{-}} \bullet \mathrm{K}_{\mathrm{a}}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{[\text { Acid }]}{[\text { Conj. base }]} \bullet \mathrm{K}_{\mathrm{a}}$ or $\left[\mathrm{OH}^{-}\right]=\frac{[\text { Base }]}{[\text { Conj. acid }]} \bullet \mathrm{K}_{\mathrm{b}}$
Notice that $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$or $[\mathrm{OH}]$ depend on K and the ratio of acid and base concentrations

Henderson-Hasselbalch Equation

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { Conj. base }]}{[\text { Acid }]}
$$

Note that the CONCENTRATIONS of the acid and conjugate base are not important.
It is the RATIO of the NUMBER OF MOLES that affects pH
Result: diluting a buffer solution does not change its pH
Result: You can use moles or molarity when using Henderson-Hasselbalch!
See: Buffers and Henderson-Hasselbalch Guide

## Adding an Acid to a Buffer

What is the pH when 1.00 mL of 1.00 M HCl is added to a) $\quad 1.00 \mathrm{~L}$ of pure water (after $\mathrm{HCl}, \mathrm{pH}=3.00$ ) b) 1.00 L of buffer that has $[\mathrm{HOAc}]=0.700 \mathrm{M}$ and [ $\mathrm{OAc}-\mathrm{l}=0.600 \mathrm{M}(\mathrm{pH}=4.68)$

Solution to Part (b)
Step 1 - do the stoichiometry
$\mathrm{H}_{3} \mathrm{O}^{+}($from HCl$)+\mathrm{OAc}$ - (from buffer) $--->$
HOAc (from buffer)
The reaction occurs completely because K is very large.

## Adding an Acid to a Buffer

Problem: What is the pH when 1.00 mL of 1.00 M HCl is added to
a) 1.00 L of pure water (before $\mathrm{HCl}, \mathrm{pH}=$ 7.00)
b) 1.00 L of buffer that has [HOAc] $=0.700 \mathrm{M}$ and [OAc-] $=0.600 \mathrm{M}$ ( $\mathrm{pH}=4.68$ )
Solution to Part (a)
$p H$ of strong acid $=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log [\mathrm{HCl}]$
$\mathbf{M}_{1} \cdot \mathrm{~V}_{1}=\mathrm{M}_{\mathbf{2}} \cdot \mathrm{V}_{\mathbf{2}}$
1.00 M * $1.00 \mathrm{~mL}=\mathrm{M}_{\mathbf{2}} \cdot 1001 \mathrm{~mL}$
$\mathrm{M}_{2}=9.99 \times 10^{-4} \mathrm{M}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ $\mathrm{pH}=3.00$
MAR

## Adding an Acid to a Buffer

What is the pH when 1.00 mL of 1.00 M HCl is added to a) $\quad 1.00 \mathrm{~L}$ of pure water (after $\mathrm{HCl}, \mathrm{pH}=3.00$ ) b) $\quad 1.00 \mathrm{~L}$ of buffer that has [HOAc] $=0.700 \mathrm{M}$ and [OAc-] $=0.600 \mathrm{M}(\mathrm{pH}=4.68)$

Solution to Part (b): Step 1-Stoichiometry

|  | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ | $[\mathrm{OAc}-]$ | $[\mathrm{HOAc}]$ |
| :--- | :--- | :--- | :--- |
| Initial | 0.000999 | 0.600 | 0.700 |
| Change | -0.000999 | -0.000999 | +0.000999 |
| After rxn | 0 | 0.599 | 0.701 |

Now we need to calculate pH using

## Adding an Acid to a Buffer

What is the $\mathbf{p H}$ when 1.00 mL of 1.00 M HCl is added to a) 1.00 L of pure water (after $\mathrm{HCl}, \mathrm{pH}=3.00$ ) b) 1.00 L of buffer that has $[\mathrm{HOAc}]=0.700 \mathrm{M}$ and [OAc-] $=0.600 \mathrm{M}(\mathrm{pH}=4.68)$

Solution to Part (b): Step 2 - Equilibrium

```
HOAc + H2O \rightleftharpoons H
```

|  | $[\mathrm{HOAc}]$ | $[\mathrm{OAc}-]$ | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |
| :--- | :--- | :--- | :--- |
| Initial | 0.701 | 0.599 | 0 |
| Change | -x | +x | +x |
| Equilibrium | $0.701-\mathrm{x}$ | $0.599+\mathrm{x}$ | x |

## Adding an Acid to a Buffer

What is the pH when 1.00 mL of 1.00 M HCl is added to
a) $\quad 1.00 \mathrm{~L}$ of pure water (after $\mathrm{HCl}, \mathrm{pH}=3.00$ ) b) $\quad 1.00 \mathrm{~L}$ of buffer that has $[\mathrm{HOAc}]=\mathbf{0 . 7 0 0} \mathbf{M}$ and [OAc-] $=0.600 \mathrm{M}$ ( $\mathrm{pH}=4.68$ )

Solution to Part (b): Step 2 - Equilibrium

$$
\mathrm{HOAc}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OAc}^{-}
$$

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{[\mathrm{HOAc}]}{\left[\mathrm{OAc}^{-}\right]} \bullet K_{a}=\frac{0.701}{0.599} \bullet\left(1.8 \times 10^{-5}\right)
$$

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=2.1 \times 10^{-5} \mathrm{M} \quad \cdots-\cdots \mathrm{pH}=4.68
$$

The pH has not changed on adding HCl to the buffer!

## Adding an Acid to a Buffer

What is the pH when 1.00 mL of 1.00 M HCl is added to a) $\quad 1.00 \mathrm{~L}$ of pure water (after $\mathrm{HCl}, \mathrm{pH}=3.00$ ) b) 1.00 L of buffer that has [HOAc] $=0.700 \mathrm{M}$ and [OAc-] $=0.600 \mathrm{M}(\mathrm{pH}=4.68)$

Solution to Part (b): Step 2 - Equilibrium

Because $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=2.1 \times 10^{-5} \mathrm{M}$ BEFORE adding HCl , we again neglect $x$ relative to 0.701 and 0.599 .

## Adding an Acid to a Buffer

Use the Henderson-Hasselbalch equation to calculate the pH when 1.00 mL of 1.00 M HCl is added to 1.00 L of buffer that has $[\mathrm{HOAc}]=0.700 \mathrm{M}$ and $[\mathrm{OAc}-]=0.600 \mathrm{M}$

We can use an alternate form of the H-H equation:

$$
\begin{aligned}
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left(\mathbf{m o l}_{\text {Conj base }}-\mathbf{m o l}_{\text {strong acid }}\right)}{\left(\mathbf{m o l}_{\text {weak acid }}+\mathbf{m o l}_{\text {strong acid }}\right)} \\
& \mathrm{pK}_{\mathrm{a}}=-\log (1.80 * 10-5)=4.74 \\
& \mathrm{pH}=4.74+\log \frac{(0.600-0.00100)}{(0.700+0.00100)}=4.67
\end{aligned}
$$

Answer in good agreement with "double ice" method (4.68)
See: Buffers and Henderson-Hasselbalch Guide

## Adding Acids and Bases to Buffers

For adding strong acids to buffers:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left(\mathrm{mol}_{\text {Conj base }}-\mathbf{m o l}_{\text {strong acid }}\right)}{\left(\text { mol }_{\text {weak acid }}+\mathbf{m o l}_{\text {strong acid }}\right)}
$$

For adding strong bases to buffers:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left(\mathrm{mol}_{\text {Conj base }}+\mathrm{mol}_{\text {strong base }}\right)}{\left(\mathrm{mol}_{\text {weak acid }}-\mathrm{mol}_{\text {strong base }}\right)}
$$

Very useful for calculating pH changes in buffers! See: Buffers and Henderson-Hasselbalch Guide

## Preparing a Buffer

You want to create a buffer solution with a $\mathrm{pH}=4.30$.
This means $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10-\mathrm{pH}=5.0 \times 10^{-5} \mathrm{M}$

Henderson
It is best to choose an acid such that:

* $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \approx \mathrm{K}$, or
* $\mathrm{pH} \approx \mathrm{pK}_{\mathrm{a}}$

Hasselbalch
You get the exact $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right.$] (or pH ) by adjusting the ratio of weak acid to conjugate base.
For a $\mathrm{pH}=4.30$ buffer, we will look for a value of $K_{a} \approx 5.0 \times 10^{-5}$ or a $\mathrm{pK}_{\mathrm{a}} \approx 4.30$

## Preparing a Buffer

You wish to create a buffer solution at $\mathrm{pH}=4.30$ (or
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.0 \times 10^{-5} \mathrm{M}$.) Which of these buffer
combinations should you select?

$\mathrm{POSSIBLE}^{2}$
$\mathrm{HSO}_{4} / \mathrm{SO}_{4}{ }^{2-}$
$\mathrm{HOACFRS}^{-} / \mathrm{OAc}^{-}$
$\mathrm{HCN} / \mathrm{CN}$

Best choice is acetic acid / acetate - closest in [ $\mathrm{H}_{3} \mathrm{O}^{+}$] to $\mathrm{K}_{\mathrm{a}}$ or pH to $\mathrm{pK}_{\mathrm{a}}$ !

## Preparing a Buffer

You want to create a buffer solution at $\mathrm{pH}=4.30$ (or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=$ $5.0 \times 10^{-5} \mathrm{M}$ ). Find the ratio of acid to base needed to get the buffer to 4.30 .
[HOAc] $/[\mathrm{OAc}-$ ] ratio $=2.8 / 1$ (previous slide)
Therefore, if you use $\mathbf{0 . 1 0} \mathbf{~ m o l}$ of $\mathbf{N a O A c}$ and $\mathbf{0 . 2 8} \mathbf{~ m o l}$ of HOAc, you will have $\mathrm{pH}=4.30$.

$$
\begin{aligned}
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { [Conj. base }]}{[\text { Acid }]} \\
& 4.30=4.74+\log \frac{\text { [Conj. base }]}{[\text { Acid }]} \\
& 10^{-0.44}=0.36^{*}[\text { base }] /[\text { acid] } \text {, invert }: \\
& {[\text { acid }] /[\text { base }]=2.8}
\end{aligned}
$$

## Titration Calculations

Allow us to calculate pH at any point in a titration We will study four types of titrations:

- SA + SB (equivalence $\mathrm{pH}=7$ )
- $\mathrm{SB}+\mathrm{SA}$ (equivalence $\mathrm{pH}=7$ )
- WA + SB (equivalence $\mathrm{pH}>7$ )
- WB + SA (equivalence $\mathrm{pH}<7$ )

Titrations separated into regions each with their own pH formula
Buffers used in WA + SB and WB + SA
We will do examples of all four as practice in lab.

MAR

## Preparing a Buffer Solution

Buffer prepared from
$8.4 \mathrm{~g} \mathrm{NaHCO}_{3}$
weak acid
$16.0 \mathrm{~g} \mathrm{Na}_{2} \mathrm{CO}_{3}$
conjugate base
$\mathrm{HCO}_{3}{ }^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{CO}_{3}{ }^{2-}$
What is the pH ?

Check yourself! Answer: 10.50

## Preparing a Buffer

You want to create a buffer solution at $\mathrm{pH}=4.30$ (or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.0 \times 10^{-5} \mathrm{M}$ ) using HOAc and $\mathrm{OAc}^{-1}$.
Equal moles of acid (HOAc) and base ( $\mathrm{OAc}^{-1}$ ) create $\mathrm{pH}=4.74$ (= $\mathrm{pK}_{\mathrm{a}}$ ). Find the ratio of acid to base needed to get the buffer to 4.30.

$$
\mathrm{K}_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]} \text {, or rearranged: }
$$

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.0 \times 10^{-5}=\frac{[\mathrm{HOAc}]}{\left[\mathrm{OAc}^{-}\right]}\left(1.8 \times 10^{-5}\right)
$$

Solve for [HOAc] / [OAc-] ratio:
$=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] / \mathrm{K}_{\mathrm{a}}=2.8 / 1$

## Strong Acid + Strong Base

A strong acid + strong base titration

## Acid-Base Reactions

QUESTION: You titrate $\mathbf{5 0} \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathbf{~ M}$ solution of HCl with 0.100 M NaOH . What is the pH of the initial solution?
$\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O}-->\mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
SOLUTION:
HCl is a strong acid
NaOH is a strong base
Hence, this is a strong acid + strong base titration Other common strong acids: $\mathrm{HNO}_{3}, \mathrm{HBr}, \mathrm{HI}, \mathrm{HClO}_{4}$ Other common strong bases: $\mathrm{KOH}, \mathrm{LiOH}$

## Acid-Base Reactions

QUESTION: You titrate $50 . \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathbf{M}$ solution of $\mathbf{~ H C I}$ with 0.100 M NaOH . What is the pH after 45 mL of NaOH have been added?
$\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O}$---> $\mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
SOLUTION:
First, determine which region of a strong acid and strong base titration to use by comparing mol HCl to mol NaOH
$\mathrm{n}_{\mathrm{sa}}=0.050 \mathrm{~L} * 0.100 \mathrm{M}=0.0050 \mathrm{~mol} \mathrm{HCl}$
$n_{\text {sb }}=0.045 \mathrm{~L} * 0.100 \mathrm{M}=0.0045 \mathrm{~mol} \mathrm{NaOH}$
Since $n_{s a}>n_{s b}$, this pH will fall in the pre-equivalence region

## Strong Acid + Strong Base

Initial:
Pre-equivalence: $\mathrm{pH}=-\log \left[\mathrm{n}_{\mathrm{sa}} / \mathrm{V}_{\mathrm{sa}}\right]$
$\mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+V_{\mathrm{sb}}}\right)$
Equivalence:
Post-equivalence: $\quad \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{sa}}}\right)$

## Acid-Base Reactions

QUESTION: You titrate $50 . \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathbf{~ M}$ solution of HCl with 0.100 M NaOH . What is the pH of the initial solution?
$\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O}-->\mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
SOLUTION:
For strong acids, $\quad \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
$\mathrm{pH}=-\log (0.100)$
$\mathrm{pH}=1.000$

## Acid-Base Reactions

QUESTION: You titrate $\mathbf{5 0} \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathbf{~ M}$ solution of $\mathbf{~ H C I}$ with 0.100 M NaOH . What is the pH after 45 mL of NaOH have been added?
$\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O}---\mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
From before: $\mathbf{n}_{\text {sa }}=0.0050 \mathrm{~mol}, \mathrm{n}_{\mathrm{sb}}=\mathbf{0 . 0 0 4 5} \mathrm{mol}$

$$
\begin{aligned}
\mathrm{pH} & =-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{~V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right) \\
\mathrm{pH} & =-\log \left(\frac{0.0050-0.0045}{0.050+0.045}\right) \\
\mathrm{pH} & =2.3
\end{aligned}
$$

## Acid-Base Reactions

QUESTION: You titrate $50 . \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathbf{~ M}$ solution of HCl with 0.100 M NaOH . What is the pH at the equivalence point?
At equivalence, $\mathrm{HCl}+\mathrm{NaOH}-->\mathrm{Na}^{+}+\mathrm{Cl}^{-}+\mathrm{H}_{2} \mathrm{O}$
Only species present at equivalence are $\mathrm{Na}^{+}, \mathrm{Cl}$ - and water.
$\mathrm{Na}^{+}$and Cl are conjugates of strong bases and acids; hence, they have no effect on the pH
pH at equivalence point will be equal to 7 (neutral) due to presence of water
The volume required to get to equivalence:
0.0050 mol HCl * (mol NaOH / mol HCl) * (L/0.100 mol NaOH) $=0.050 \mathrm{~L}$ or 50 mL

Initial:

$$
\mathrm{pH}=14+\log \left[\mathrm{n}_{\mathrm{sb}} / \mathrm{V}_{\mathrm{sb}}\right]
$$

Pre-equivalence: $\quad \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{sa}}}\right)$
Equivalence: $\quad \mathrm{pH}=7$ (neutral salt + water)
Post-equivalence: $\quad \mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{sb}}}{\mathrm{V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{sb}}}\right)$

## Acid-Base Reactions

QUESTION: You titrate $\mathbf{5 0} . \mathrm{mL}$ of a $\mathbf{0 . 1 0 0} \mathrm{M}$ solution of HCl with 0.100 M NaOH . What is the pH after 55 mL of NaOH have been added?

$$
\text { SOLUTION: (from before, } \left.n_{s a}=0.0050 \mathrm{~mol}\right)
$$

It took $\mathbf{5 0} . \mathrm{mL}$ of NaOH to reach equivalence; hence, we are now in the post-equivalence region
$\mathrm{n}_{\mathrm{sb}}=0.100 \mathrm{M} * 0.055 \mathrm{~L}=0.0055 \mathrm{~mol}$
$\mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{sa}}}\right)$
$\mathrm{pH}=14+\log \left(\frac{0.0055-0.0050}{0.055+0.050}\right)$
$\mathrm{pH}=14+(-2.3)=11.7$

## Strong Base + Strong Acid

Notice similarities between $S A+S B$ and $S B+S A$ titrations!

A strong base + strong acid titration

$$
\begin{array}{ll}
\text { Initial: } & \mathrm{pH}=-\log \sqrt{\mathrm{K}_{\mathrm{a}} \mathrm{C}_{\mathrm{wa}}} \\
\text { Pre-equivalence: } & \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}\right) \\
\text { Equivalence: } & \mathrm{pH}=14+\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{a}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{wa}}}+\right.} \\
\text { Post-equivalence: } & \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{wa}}}\right)
\end{array}
$$

## Acid-Base Reactions

QUESTION: You titrate $100 . \mathrm{mL}$ of a 0.025 M solution of benzoic acid with 0.100 M NaOH . What is the pH after 10. mL of NaOH have been added? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$

From before: $\mathrm{n}_{\mathrm{wa}}=0.0025 \mathrm{~mol}, \mathrm{n}_{\mathrm{sb}}=0.0010 \mathrm{~mol}$
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log \left(6.3^{*} 10^{-5}\right)=4.20$

$$
\begin{aligned}
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}\right) \quad\left\{\begin{array}{l}
\text { A version of the } \\
\text { Henderson-Hasselbalch } \\
\text { equation! }
\end{array}\right. \\
& \mathrm{pH}=4.20+\log \left(\frac{0.0010}{0.0025-0.0010}\right) \\
& \mathrm{pH}=4.20-0.176=4.02
\end{aligned}
$$

## Acid-Base Reactions

QUESTION: You titrate 100. mL of a $\mathbf{0 . 0 2 5} \mathbf{~ M}$ solution of benzoic acid with 0.100 M NaOH . What is the pH of the initial solution? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$
$\mathrm{HBz}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{Bz}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$

## Acid-Base Reactions

QUESTION: You titrate $100 . \mathrm{mL}$ of a 0.025 M solution of benzoic acid with 0.100 M NaOH . What is the pH of the initial solution? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10-5$
$\mathrm{HBz}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{Bz}+\mathrm{H}_{3} \mathrm{O}^{+}$
SOLUTION:
For weak acids,

$$
\begin{aligned}
& \mathrm{pH}=-\log \sqrt{\mathrm{K}_{\mathrm{a}} \mathrm{C}_{\mathrm{wa}}} \\
& \mathrm{pH}=-\log \sqrt{\left(6.3^{*} 10^{-5}\right)(0.025)} \\
& \mathrm{pH}=\mathbf{2 . 9 0}
\end{aligned}
$$

$\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}=\mathrm{HBz}$ Benzoic acid

MAR

## Acid-Base Reactions

QUESTION: You titrate $100 . \mathrm{mL}$ of a 0.025 M solution of benzoic acid with 0.100 M NaOH . What is the pH after 10. mL of NaOH have been added? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$
$\mathrm{HBz}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{Bz}+\mathrm{H}_{3} \mathrm{O}^{+}$
SOLUTION:
First, determine which region of a weak acid (benzoic acid) and strong base $(\mathrm{NaOH})$ titration to use by comparing mol HBz to mol NaOH
$\mathrm{n}_{\mathrm{wa}}=0.100 \mathrm{~L}^{*} 0.025 \mathrm{M}=0.0025 \mathrm{~mol} \mathrm{HBz}$
$\mathrm{n}_{\mathrm{sb}}=0.010 \mathrm{~L}$ * $0.100 \mathrm{M}=0.0010 \mathrm{~mol} \mathrm{NaOH}$
Since $n_{\text {wa }}>n_{\text {sb }}$, this pH will fall in the pre-equivalence region Note that because $\mathrm{n}_{\mathrm{sb}}$ is converted to mol Bz (the conjugate base), this region acts like a buffer

## Acid-Base Reactions

QUESTION: You titrate 100. mL of a 0.025 M solution of benzoic acid with 0.100 M NaOH . What is the pH after 12.5 mL of NaOH have been added? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$

From before: $\mathrm{n}_{\mathrm{wa}}=0.0025 \mathrm{~mol}, \mathrm{pK}_{\mathrm{a}}=4.20$
$\mathbf{n}_{\text {sb }}=0.0125 \mathrm{~L}$ * $0.100 \mathrm{M}=0.00125 \mathrm{~mol} \mathrm{NaOH}$
Since $n_{w a}>n_{\text {sb }}$, this is the pre-equivalence region

$$
\begin{gathered}
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}}{\mathrm{n}_{\mathrm{wa}}-\mathrm{n}_{\mathrm{sb}}}\right) \\
\mathrm{pH}=4.20+\log \left(\frac{0.00125}{0.0025-0.00125}\right)=4.20+\log (1) \\
\mathrm{pH}=4.20+0=4.20
\end{gathered}
$$

## Acid-Base Reactions

QUESTION: You titrate 100 mL of a 0.025 M solution of benzoic acid with 0.100 M NaOH . What is the pH after 12.5 mL of NaOH have been added? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$

Before: $\mathrm{n}_{\mathrm{wa}}=0.0025 \mathrm{~mol}, \mathrm{pK}_{\mathrm{a}}=4.20, \mathrm{n}_{\text {sb }}=0.00125 \mathrm{~mol}$
When $n_{\text {sb }}=1 / 2 n_{\text {wa }}$, this is called the half-equivalence region $\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}$ at the half-equivalence point Useful method of finding $K_{a}$ (and $K_{b}$ ) values
Also, the volume of titrant $(\mathrm{NaOH})$ at half equivalence is exactly half the volume necessary to reach equivalence
We will need $\left(2^{* 12.5}\right)=25 \mathrm{~mL}$ of NaOH to reach
equivalence!

## Acid-Base Reactions

QUESTION: You titrate 100. mL of a 0.025 M solution of benzoic acid with 0.100 M NaOH to the equivalence point. What is the pH at the equivalence point? $\quad \mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$
At equivalence, $\mathrm{HBz}+\mathrm{NaOH} \rightarrow \mathrm{Na}^{+}+\mathrm{Bz}^{-}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{mol} \mathrm{NaOH}=\mathrm{mol} \mathrm{HBz}$, or NaOH annihilates HBz
mol $\mathrm{HBz}=\mathrm{mol} \mathrm{Bz}-$ at equivalence, and pH dominated by conjugate base of weak acid
pH at equivalence point will be basic when titrating a weak acid with a strong base!

## Acid-Base Reactions

QUESTION: You titrate $100 . \mathrm{mL}$ of a $\mathbf{0 . 0 2 5} \mathbf{~ M}$ solution of benzoic acid with 0.100 M NaOH . What is the pH after 26.0 mL of NaOH have been added?

SOLUTION: (from before, $n_{w a}=0.0025 \mathrm{~mol}$ )
It took $\mathbf{2 5 ~ \mathbf { ~ m L }}$ of NaOH to reach equivalence; hence, we are now in the post-equivalence region
$\mathrm{n}_{\text {sb }}=0.100 \mathrm{M} * 0.026 \mathrm{~L}=0.0026 \mathrm{~mol}$

$$
\begin{aligned}
& \mathrm{pH}=14+\log \left(\frac{\mathrm{n}_{\mathrm{sb}}-\mathrm{n}_{\mathrm{wa}}}{\mathrm{~V}_{\mathrm{sb}}+\mathrm{V}_{\mathrm{wa}}}\right) \\
& \mathrm{pH}=14+\log \left(\frac{0.0026-0.0025}{0.026+0.100}\right)
\end{aligned}
$$

$$
\mathrm{pH}=14+(-3.10)=10.9
$$

## Polyprotic Acids

$$
\begin{aligned}
& \text { Weak Base + Strong Acid }
\end{aligned}
$$

$$
\begin{aligned}
& \begin{array}{l}
\text { Initial: } \\
\text { Pre-equivalence: }
\end{array} \\
& \mathrm{pH}=14+\log \sqrt{\mathrm{K}_{\mathrm{b}} \mathrm{C}_{\mathrm{wb}}} \\
& \text { Pre-equivalence: } \quad \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \left(\frac{\mathrm{n}_{\mathrm{wb}}-\mathrm{n}_{\mathrm{sa}}}{\mathrm{n}_{\mathrm{sa}}}\right) \\
& \text { Equivalence: } \\
& \mathrm{pH}=-\log \sqrt{\left(\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{b}}}\right)\left(\frac{\mathrm{n}_{\mathrm{wb}}}{\mathrm{~V}_{\mathrm{wb}}+\mathrm{V}_{\mathrm{sa}}}\right)} \\
& \mathrm{pH}=-\log \left(\frac{\mathrm{n}_{\mathrm{sa}}-\mathrm{n}_{\mathrm{wb}}}{\mathrm{~V}_{\mathrm{sa}}+\mathrm{V}_{\mathrm{wb}}}\right)
\end{aligned}
$$

Titrations of polyprotic acids with bases have multiple equivalence points (and half equivalence points) for each dissociation.

first half equivalence ( $\mathrm{pH}=\mathrm{pKa}$ for $\mathrm{H}_{2} \mathrm{PO}_{3}{ }^{-1}$ )
( $\mathrm{pH}=\mathrm{pKa}$ for $\mathrm{H}_{3} \mathrm{PO}_{3}$ )
MAR
Weak Base + Strong Acid
Equivalence point dominated by conjugate acid of weak base

A weak base + strong acid titration

pH Indicators

Equivalence point important in titration, can use an indicator to signify equivalence point
Indicator color change must reflect equivalence point to be useful!
MAR

## Color Changes for Bromthymol Blue

## pH Indicators

## Which indicator to

 use?Phenolphthalein or Methyl Red?
The pH at the equivalence point in this titration is $<7$. Methyl red is the indicator of choice here.

## End of Chapter Problems: Test Yourself

See practice problem set \#3 for additional titration and buffer examples

1. Does the pH of the solution increase, decrease, or stay the same when you: a) Add solid ammonium chloride to a dilute aqueous solution of $\mathrm{NH}_{3}$; b) Add solid sodium acetate to a dilute aqueous solution of acetic acid; c) Add solid NaCl to a dilute aqueous solution of NaOH ?
2. For each of the following cases, decide whether the pH is less than 7 , equal o 7, or greater than 7: a) equal volumes of 0.10 M acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and 0.10 M KOH are mixed; b) 25 mL of $0.015 \mathrm{M} \mathrm{NH}_{3}$ is mixed with 25 mL of 0.015 M HCl ; c) 150 mL of $0.20 \mathrm{M} \mathrm{HNO}_{3}$ is mixed with 75 mL of 0.40 M NaOH
3. What is the pH of a solution that consists of 0.20 M ammonia, $\mathrm{NH}_{3}$, and 0.20 M ammonium chloride, $\mathrm{NH}_{4} \mathrm{Cl}$ ? $\left(K_{\mathrm{a}}=5.6 \times 10^{-10}\right)$
4. What mass of sodium acetate, $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$, must be added to 1.00 L of 0.10 M acetic acid to give a solution with a pH of 4.50 ? ( $K_{\mathrm{a}}=1.8 \times 10^{-5}$ )
5. Phenol, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$, is a weak organic acid. Suppose 0.515 g of the compound is dissolved in exactly 125 mL of water. The resulting solution is titrated with $0.123 \mathrm{M} \mathrm{NaOH}: \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+\mathrm{OH}^{-1}(\mathrm{aq}) \rightleftarrows \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ a) What is the pH of the original solution of phenol? b) What are the concentrations of all of the following ions at the equivalence point: $\mathrm{Na}^{+1}$ $\mathrm{H}_{3} \mathrm{O}^{+1}, \mathrm{OH}^{-1}$, and $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}$ ? c) What is the pH of the solution at the

MAR equivalence point?

Chemistry 223 Exam I Review
Chapters 13 and 14 ("Part I \& II")

## Chemistry 223

Professor Michael Russell MAR

Given the following two equilibria:
$\mathrm{NiCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{Ni}^{2+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq}) \quad \mathrm{K}_{1}=6.6 \times 10^{-9}$
$\mathrm{HCO}_{3}-(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftharpoons \mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \quad \mathrm{K}_{2}=4.8 \times 10^{-11}$
calculate the equilibrium constant for the following reaction:
$\mathrm{NiCO}_{3}(\mathrm{~s})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \rightleftharpoons \mathrm{Ni}^{2+}(\mathrm{aq})+\mathrm{HCO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
A. $7.3 \times 10^{-3}$
B. $3.2 \times 10^{-19}$
C. 140
D. $1.8 \times 10^{-9}$
E. 1100

We place 0.010 mol of $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$ in a 2.0 L flask at 200
${ }^{\circ} \mathrm{C}$. After reaching equilibrium, $\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.0038 \mathrm{M}$.
Calculate $\mathrm{K}_{\mathrm{c}}$ for the following reaction:

$$
\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})
$$

A. 1600
B. $1.5 \times 10^{-3}$
C. $6.1 \times 10^{-4}$
D. $8.8 \times 10^{-6}$
E. $-3.1 \times 10^{-3}$

$$
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}), \mathrm{K}_{\mathrm{c}}=54.3
$$

Initially, $\left[\mathrm{H}_{2}\right]=0.00623 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00414 \mathrm{M}$, and $[\mathrm{HI}]=$ 0.0424 M . Find the equilibrium concentrations.
A. $\left[\mathrm{H}_{2}\right]=0.00201 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00112 \mathrm{M},[\mathrm{HI}]=0.0643 \mathrm{M}$
B. $\left[\mathrm{H}_{2}\right]=0.00222 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00168 \mathrm{M},[\mathrm{HI}]=0.0112 \mathrm{M}$
C. $\left[\mathrm{H}_{2}\right]=0.00917 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00667 \mathrm{M},[\mathrm{HI}]=0.0212 \mathrm{M}$
D. $\left[\mathrm{H}_{2}\right]=0.00676 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00467 \mathrm{M},[\mathrm{HI}]=0.0414 \mathrm{M}$
E. $\left[\mathrm{H}_{2}\right]=0.00623 \mathrm{M},\left[\mathrm{I}_{2}\right]=0.00414 \mathrm{M},[\mathrm{HI}]=0.0424 \mathrm{M}$

MAR

You add 0.535 g of $\mathrm{NaOH}\left(\mathrm{MM}=40.0 \mathrm{~g} \mathrm{~mol}^{-1}\right)$ to 100.0 mL of water at $25^{\circ} \mathrm{C}$. What is $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$in this solution?
A. 0.134 M
B. $7.48 \times 10^{-14} \mathrm{M}$
C. $1.34 \times 10^{13} \mathrm{M}$
D. $6.87 \times 10^{-12} \mathrm{M}$

Considering only $\mathrm{H}_{2} \mathrm{~S}\left(\mathrm{~K}_{\mathrm{a}}=1 \times 10^{-7}\right)$ and $\mathrm{HCN}\left(\mathrm{K}_{\mathrm{a}}=4 \times 10^{-10}\right)$, predict in which direction the following equilibrium lies: $\mathrm{HCN}(\mathrm{aq})+\mathrm{HS}-(\mathrm{aq}) \rightleftharpoons \mathrm{CN}-(\mathrm{aq})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})$
A. equilibrium lies to the left
B. equilibrium lies to the right
C. equilibrium is perfectly balanced left and right
D. cannot be determined

What is $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$in a 0.10 M solution of HCN at $25^{\circ} \mathrm{C}$ ? ( $\mathrm{K}_{\mathrm{a}}$ for $\mathrm{HCN}=4.0 \times 10^{-10}$ )
A. $1.6 \times 10^{-9} \mathrm{M}$
B. $6.3 \times 10^{-6} \mathrm{M}$
C. $2.0 \times 10^{-5} \mathrm{M}$
D. $4.0 \times 10^{-11} \mathrm{M}$
E. 0.10 M

In a 0.15 M solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$, what are $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$, $\left[\mathrm{OH}^{-}\right]$ and the pH ? $\mathrm{K}_{\mathrm{b}}$ for $\mathrm{CO}_{3}{ }^{2-}$ is $2.1 \times 10^{-4}$.
A.

| $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ | $\left[\mathrm{OH}^{-}\right]$ | $\mathbf{p H}$ |
| :---: | :---: | :---: |
| $5.6 \times 10^{-3}$ | $1.8 \times 10^{-12}$ | 5.61 |
| $1.8 \times 10^{-12}$ | $5.6 \times 10^{-3}$ | 11.75 |
| $5.6 \times 10^{-3}$ | $1.8 \times 10^{-12}$ | 11.75 |
| $1.8 \times 10^{-12}$ | $5.6 \times 10^{-3}$ | 5.61 |

Classify the following as Lewis acids or bases.

$$
\mathrm{BH}_{3}, \mathrm{NH}_{3}, \mathrm{Cl}^{-1}, \mathrm{Al}^{3+}, \mathrm{Cr}^{3+}
$$

A. acid, base, base, acid, acid
B. base, base, base, acid, acid
C. base, acid, acid, base, base
D. acid, base, acid, base, base
E. Public Enemy is \#1!

Place the following acids in order of increasing acid strength.
(a) Anilinium ion, $\mathrm{pK}_{\mathrm{a}}=4.60$
(b) Benzilic acid, $\mathrm{pK}_{\mathrm{a}}=3.09$
(c) Chloroacetic acid, $\mathrm{pK}_{\mathrm{a}}=2.98$
(d) Dibromophenol, $\mathrm{pK}_{\mathrm{a}}=8.06$
A. a, b, c, d
B. d, c, b, a
C. c, b, a, d
D. d, a, b, c
E. a, c, d, c

You have a solution of $\mathrm{NH}_{4} \mathrm{Cl}$. What effect will addition of $\mathrm{NH}_{3}$ have on the pH of the solution?
A. increase pH
B. no effect
C. decrease pH
D. cannot tell from information given

You have a solution of $\mathrm{NH}_{4} \mathrm{Cl}$. What effect will addition of NaCl have on the pH of the solution?
A. increase pH
B. no effect
C. decrease pH
D. cannot tell from information given

Which choice would be an ideal buffer solution?
A. 0.20 M HCN and 0.10 M KCN
B. 0.20 M HCl and 0.10 M KOH
C. $0.20 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and $0.10 \mathrm{M} \mathrm{HCO}_{2} \mathrm{H}$
D. 0.10 HCl and 0.010 M KCl
E. $0.10 \mathrm{M} \mathrm{CH}_{3} \mathrm{OH}$ and 0.10 M NaOH

## MAR

What is the pH of a buffer that is composed of $0.20 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and $0.20 \mathrm{M} \mathrm{NH}_{3}$ ? $\left(\mathrm{K}_{\mathrm{a}}\right.$ for $\mathrm{NH}_{4}{ }^{+}=$ $5.6 \times 10^{-10}$ )
A. 4.85
B. 5.65
C. 7.00
D. 9.25
E. 10.05

MAR

What volume of 0.10 M sodium acetate must be added to 100 . mL of 0.10 M acetic acid ( $\mathrm{K}_{\mathrm{a}}=1.8$ $x 10^{-5}$ ) to have a pH of 4.00 ?
A. 100. mL
B. 50 . mL
C. 36 mL
D. 18 mL
E. 9.0 mL

What is the pH of a buffer that is composed of $0.20 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and $0.50 \mathrm{M} \mathrm{NH}_{3}$ ? ( $\mathrm{K}_{\mathrm{a}}$ for $\mathrm{NH}_{4}{ }^{+}=$ $5.6 \times 10^{-10}$ )
A. 4.75
B. 5.65
C. 7.00
D. 9.25
E. 9.65

MAR

What type of titration does the graph below represent?
$\left.\begin{array}{ll|l|}\text { A. strong acid + strong base } & \\ \text { B. } \\ \text { B. strong base }+ \text { strong acid }\end{array}\right)$

You mix 15.0 mL of 0.400 M HCl with 15.0 mL of $0.400 \mathrm{M} \mathrm{NH}_{3}$. What is the pH of the resulting solution? $\left(K_{b}=1.8 \times 10^{-5}\right)$
A. 11.43
B. 9.26
C. 7.00
D.5.54
E. 4.98

## MAR

What is the pH of the solution when 50 mL of 0.10 M HCl and $100 . \mathrm{mL}$ of 0.10 M NaCN are mixed? $\mathrm{K}_{\mathrm{a}}(\mathrm{HCN})=4.0 \times 10^{-10}$
A. 8.65
B. 8.80
C. 5.20
D. 5.35
E. 9.40
0.40 g of $\mathrm{NaOH}(\mathrm{MM}=40 . \mathrm{g} / \mathrm{mol})$ are mixed with 100 mL of 0.10 M acetic acid. What is the pH of the resulting solution? $\left(\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}\right)$
A. 1.00
B. 2.87
C. 7.00
D. 8.87
E. 13.00

MAR

Add $40 . \mathrm{mL}$ of 0.50 M NaOH to 50.0 mL of 1.00 $\mathrm{M} \mathrm{NH} 4{ }_{4} \mathrm{Cl}$. What is the pH of the resulting solution? $\mathrm{K}_{\mathrm{b}}\left(\mathrm{NH}_{3}\right)=1.8 \times 10^{-5}$
A. 4.56
B. 4.74
C. 7.00
D. 9.08
E. 10.70

## PRECIPITATION REACTIONS Chapter 15

Chemistry 223
Professor Michael Russell

Flashback - Aqueous Salts!

|  | If one ion from the "Soluble Compd." list is present in a compound, the compound is water soluble. |  |
| :---: | :---: | :---: |
|  | EXCEPTIONS |  |
|  |  | $\mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})$ |
| Conpounds containing F - |  |  |
| Salto of sulfe, $5 \mathrm{~S}_{4}^{2}$ - | Sulfates of $\mathrm{Ca}^{2+}, \mathrm{Sc}^{2+}+\mathrm{Ba}^{2}+\mathrm{Pb}^{2+}$ |  |
| tusoluble compoumos | exceptions | $\mathrm{BaCl}_{2}(\mathrm{aq}) ?$ |
| Most salts of carbonate, $\mathrm{CO}_{3}{ }^{2-}$ phosphate, $\mathrm{PO}_{4}{ }^{3-}$ oxalate, $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{-}$ chromate, $\mathrm{CrO}_{4}$ |  |  |
| Must metala sufieses $s^{s^{-}}$ | Salto of $\mathrm{NH}_{4}^{+}$and the alali metal cations | $\mathrm{BaSO}_{4}(\mathrm{aq})$ |
| Mest metal hydoxides and oxidss | $\mathrm{Ba}_{3}(\mathrm{OH})_{2}$ is soluble | insoluble, |

## Solubility of a Salt

$\mathrm{AgCl} \mathrm{PbCl}_{2} \mathrm{Hg}_{2} \mathrm{Cl}_{2}$
Although all salts formed in this experiment are said to be insoluble, they do dissolve to some SLIGHT extent
$\mathrm{AgCl}(\mathrm{s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq})$
When equilibrium has been established, no more AgCl dissolves and the solution is SATURATED

Analysis of Silver Group

All salts formed in this experiment are said to be INSOLUBLE

They form when mixing moderately concentrated solutions of the metal ion with chloride ions.

,

When solution is SATURATED, expt. shows that $\left[\mathrm{Ag}^{+}\right]=1.67 \times 10^{-5} \mathrm{M}$.

This is equivalent to the SOLUBILITY of AgCl .
What is [ $\mathrm{Cl}-]$ ?
This is also equivalent to the AgCl solubility, so $[\mathrm{Cl}-]=1.67 \times 10^{-5} \mathbf{~ M}$

## Solubility of Lead(II) lodide

Consider $\mathrm{Pbl}_{2}$ dissolving in water $\mathrm{PbI}_{2}(\mathbf{s}) \rightleftharpoons \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{I}(\mathrm{aq})$
Calculate $\mathrm{K}_{\text {sp }}$ if solubility $=0.00130 \mathrm{M}$
Solution

1. Solubility $=\left[\mathrm{Pb}^{2+}\right]$
$=1.30 \times 10^{-3} \mathrm{M}$
$[\mathrm{I}]=2 \times\left[\mathrm{Pb}^{2+}\right]=2.60 \times 10^{-3} \mathrm{M}$
2. $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right][\mathrm{I}-]^{2}$

$$
\begin{aligned}
& =\left[\mathrm{Pb}^{2+}\right]\left\{2 \cdot\left[\mathrm{~Pb}^{2+}\right]\right\}^{2} \\
& =4\left[\mathrm{~Pb}^{2+}\right]^{3}
\end{aligned}
$$

## Lead(II) Chloride

$\mathrm{PbCl}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{Cl}-(\mathrm{aq})$
$\mathrm{K}_{\mathrm{sp}}=1.9 \times 10.5$

See: Solubility Guide
MAR

Table 18.2 - Some Common, Slightly Soluble Compounds and Their $K_{\text {sp }}$ Values*

| Formula | Name | $K_{\text {sp }}\left(25{ }^{\circ} \mathrm{C}\right)$ | Common Names/Uses |
| :---: | :---: | :---: | :---: |
| $\mathrm{CaCO}_{3}$ | Calcium carbonate | $3.4 \times 10^{-9}$ | Calcite, Iceland spar |
| $\mathrm{MnCO}_{3}$ | Manganese(II) carbonate | $2.3 \times 10^{-11}$ | Rhodochrosite (forms rose-colored crystals) |
| $\mathrm{FeCO}_{3}$ | Iron(II) carbonate | $3.1 \times 10^{-11}$ | Siderite |
| $\mathrm{CaF}_{2}$ | Calcium fluoride | $5.3 \times 10^{-11}$ | Fluorite (source of HF and other inorganic fluorides) |
| AgCl | Silver chloride | $1.8 \times 10^{-10}$ | Chlorargyrite |
| AgBr | Silver bromide | $5.4 \times 10^{-13}$ | Used in photographic film |
| $\mathrm{CaSO}_{4}$ | Calcium sulfate | $4.9 \times 10^{-5}$ | Hydrated form is commonly called gypsum |
| $\mathrm{BaSO}_{4}$ | Barium sulfate | $1.1 \times 10^{-10}$ | Barite (used in "drilling mud" and as a component of paints) |
| $\mathrm{SrSO}_{4}$ | Strontium sulfate | $3.4 \times 10^{-7}$ | Celestite |
| $\mathrm{Ca}(\mathrm{OH})_{2}$ | Calcium hydroxide | $5.5 \times 10^{-5}$ | Slaked time |

New York NY (1999). Additional K values are given in Appendix 3

## Solubility of Lead(II) lodide

Consider $\mathrm{Pbl}_{2}$ dissolving in water
$\mathrm{PbI}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{I}-(\mathrm{aq})$
Calculate $\mathrm{K}_{\text {sp }}$ if solubility $\mathbf{= 0 . 0 0 1 3 0} \mathbf{M}$
Solution
Solubility refers to how many moles of solid dissolve per $L$

1. Solubility $=\left[\mathrm{Pb}^{2+}\right]$

$$
=1.30 \times 10^{-3} \mathrm{M}
$$

$[\mathrm{l}]=2 \times\left[\mathrm{Pb}^{2+}\right]=2.60 \times 10^{-3} \mathrm{M}$

MAR

Solubility of Lead(II) lodide
Consider $\mathrm{Pbl}_{2}$ dissolving in water $\mathrm{PbI}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{I}(\mathrm{aq})$
Calculate $\mathrm{K}_{\text {sp }}$ if solubility $\mathbf{= 0 . 0 0 1 3 0} \mathbf{M}$
Solution
2. $\mathrm{K}_{\mathrm{sp}}=4\left[\mathrm{~Pb}^{2+}\right]^{3}=4$ (solubility) ${ }^{3}$

$$
\mathrm{K}_{\text {sp }}=4\left(1.30 \times 10^{-3}\right)^{3}=8.79 \times 10^{-9}
$$

Notice that solubility of $\mathrm{Pbl}_{2}(x)$ and $K_{\text {sp }}$ related here by: $K_{\text {sp }}=4 x^{3}$

## Solubility and $\mathbf{K}_{\text {sp }}$ Relations

See: Solubility Guide
MAR

## Precipitating an Insoluble Salt

$\mathrm{Hg}_{2} \mathrm{Cl}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Hg}_{2}{ }^{2+}(\mathrm{aq})+2 \mathrm{Cl}-(\mathrm{aq})$
$\mathrm{K}_{\mathrm{sp}}=1.1 \times 10^{-18}=\left[\mathrm{Hg}_{2}{ }_{2}{ }^{2+}\right][\mathrm{Cl}]^{2}$
If $\left[\mathrm{Hg}_{2}{ }^{2+}\right]=0.010 \mathrm{M}$, what $[\mathrm{Cl}]$ is req'd to just begin the precipitation of $\mathrm{Hg}_{2} \mathrm{Cl}_{2}$ ?

That is, what is the maximum [ Cl -] that can be in solution with $0.010 \mathrm{M} \mathrm{Hg}_{2}{ }^{2+}$ without forming $\mathrm{Hg}_{2} \mathrm{Cl}_{2}$ ?

## Precipitating an Insoluble Salt

$\mathrm{Hg}_{2} \mathrm{Cl}_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Hg}_{2}{ }^{2+}(\mathrm{aq})+2 \mathrm{Cl}(\mathrm{aq})$
$\mathrm{K}_{\text {sp }}=1.1 \times 10^{-18}$
Now raise $[\mathrm{Cl}]$ to 1.0 M when $\left[\mathrm{Hg}_{2}{ }^{2+}\right]=0.010 \mathrm{M}$. What is the value of $\left[\mathrm{Hg}_{2}{ }^{2+}\right]$ at this point?

## Solution

$\left[\mathrm{Hg}_{2}{ }^{2+}\right]=\mathrm{K}_{\mathrm{sp}} /[\mathrm{Cl}-]^{2}$

$$
=\mathrm{K}_{\mathrm{sp}} /(1.0)^{2}=1.1 \times 10^{-18} \mathrm{M}
$$

The concentration of $\mathrm{Hg}_{2}{ }^{2+}$ has been reduced by $1016!$

## The Common Ion Effect

Calculate the solubility of $\mathrm{BaSO}_{4}$ in (a) pure water and (b) in $0.010 \mathrm{M} \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$.
$\mathrm{K}_{\text {sp }}$ for $\mathrm{BaSO}_{4}=1.1 \times 10^{-10}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$
$\mathrm{BaSO}_{4}(\mathrm{~s}) \rightleftharpoons \mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
Solution: (part b)
So... Solubility in pure water $=1.0 \times 10^{-5} \mathrm{~mol} / \mathrm{L}$.
Now dissolve $\mathrm{BaSO}_{4}$ in water already containing 0.010 M Ba$^{2+}$.

Which way will the "common ion" shift the equilibrium? $\qquad$ Will solubility of $\mathrm{BaSO}_{4}$ be less than or greater than in pure water? $\qquad$

## The Common Ion Effect

Calculate the solubility of $\mathrm{BaSO}_{4}$ in (a) pure water and (b) in $0.010 \mathrm{M} \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$.
$\mathrm{K}_{\text {sp }}$ for $\mathrm{BaSO}_{4}=1.1 \times 10^{-10}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2}\right]$
$\mathrm{BaSO}_{4}(\mathrm{~s}) \rightleftharpoons \mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
Solution: (part b)
$K_{\text {sp }}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]=(0.010+y)(y)$
Because $y<1.0 \times 10^{-5} \mathrm{M}(=x$, the solubility in pure water), this means $0.010+y$ is about equal to 0.010 . Therefore,
$K_{\text {sp }}=1.1 \times 10^{-10}=(0.010)(y)$
$y=1.1 \times 10^{-8} \mathrm{M}=$ solubility in presence of added $\mathrm{Ba}^{2+}$ ion.

The Common Ion Effect
Calculate the solubility of $\mathrm{BaSO}_{4}$ in (a) pure water and (b) in $0.010 \mathrm{M} \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$.
$\mathrm{K}_{\text {sp }}$ for $\mathrm{BaSO}_{4}=1.1 \times 10^{-10}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$ $\mathrm{BaSO}_{4}(\mathrm{~s}) \rightleftharpoons \mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
Solution: (part a) Solubility in pure water $=\left[\mathrm{Ba}^{2+}\right]=\left[\mathrm{SO}_{4}{ }^{2-}\right]=x$
$\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]=\mathrm{x}^{2}$
$\mathrm{x}=\left(\mathrm{K}_{\mathrm{sp}}\right)^{1 / 2}=1.0 \times 10^{-5} \mathrm{M}$
Note 1:1 ratio of cation to anion: $K_{s p}=x^{2}$

## The Common Ion Effect

Calculate the solubility of $\mathrm{BaSO}_{4}$ in (a) pure water and (b) in $0.010 \mathrm{M} \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$.
$\mathrm{K}_{\text {sp }}$ for $\mathrm{BaSO}_{4}=1.1 \times 10^{-10}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$
$\mathrm{BaSO}_{4}(\mathrm{~s}) \rightleftharpoons \mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
Solution: (part b)

|  | $\left[\mathrm{Ba}^{2+}\right]$ | $\left[\mathrm{SO}_{4}{ }^{2-}\right]$ |
| :--- | :--- | :---: |
| initial | 0.010 | 0 |
| change | $+y$ | $+y$ |
| equilib. | $0.010+y$ | $y$ |

## The Common Ion Effect

Calculate the solubility of $\mathrm{BaSO}_{4}$ in (a) pure water and (b) in $0.010 \mathrm{M} \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$.
$\mathrm{K}_{\text {sp }}$ for $\mathrm{BaSO}_{4}=1.1 \times 10^{-10}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$
$\mathrm{BaSO}_{4}(\mathrm{~s}) \rightleftharpoons \mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$ Solution:

Solubility in pure water $=x=1.0 \times 10^{-5} \mathrm{M}$
Solubility in presence of added $\mathrm{Ba}^{2+}$

$$
=1.1 \times 10^{-8} \mathrm{M}
$$

Le Chatelier's Principle is followed! See: Solubility Guide

## Separating Salts by Differences in $\mathrm{K}_{\text {sp }}$

A solution contains $0.020 \mathrm{M} \mathrm{Ag}^{+}$and $0.020 \mathrm{M} \mathrm{Pb}^{2+}$. Add $\mathrm{CrO}_{4}{ }^{2-}$ to precipitate red $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ and yellow $\mathrm{PbCrO}_{4}$. Which precipitates first?
$\mathrm{K}_{\text {sp }}$ for $\mathrm{Ag}_{2} \mathrm{CrO}_{4}=9.0 \times 10^{-12}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}{ }^{2}\right]$
$\mathrm{K}_{\text {sp }}$ for $\mathrm{PbCrO}_{4}=1.8 \times 10^{-14}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{CrO}_{4}{ }^{2}\right]$

## Solution

The substance whose $K_{\text {sp }}$ is first exceeded precipitates first.
The ion requiring the lesser amount of $\mathrm{CrO}_{4}{ }^{2-}$ ppts. first.

Separating Salts by Differences in $\mathbf{K}_{\text {sp }}$
A solution contains $0.020 \mathrm{M} \mathrm{Ag}^{+}$and $0.020 \mathbf{M ~ P b}^{2+}$. Add $\mathrm{CrO}_{4}{ }^{2-}$ to precipitate red $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ and yellow $\mathrm{PbCrO}_{4} . \mathrm{PbCrO}_{4}$ ppts. first.
$\mathrm{K}_{\text {sp }}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=9.0 \times 10^{-12}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}{ }^{2-}\right]$
$\mathrm{K}_{\mathrm{sp}}\left(\mathrm{PbCrO}_{4}\right)=1.8 \times 10^{-14}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{CrO}_{4}{ }^{2-}\right]$
How much $\mathrm{Pb}^{2+}$ remains in solution when $\mathrm{Ag}^{+}$begins to precipitate (at $2.3 \times 10^{-8} \mathrm{M}$ )?

## Solution

We know that $\left[\mathrm{CrO}_{4}{ }^{2-}\right]=2.3 \times 10^{-8} \mathrm{M}$ to begin to precipitate $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$.
What is the $\mathrm{Pb}^{2+}$ conc. at this point?

## Separating Salts by Differences in $\mathrm{K}_{\text {sp }}$

A solution contains $0.020 \mathbf{M ~ A g}^{+}$and $0.020 \mathbf{M ~ P b}^{2+}$. Add $\mathrm{CrO}_{4}{ }^{2-}$ to precipitate red $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ and yellow $\mathrm{PbCrO}_{4}$.
$\mathrm{K}_{\text {sp }}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=9.0 \times 10^{-12}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}{ }^{2-}\right]$
$\mathrm{K}_{\text {sp }}\left(\mathrm{PbCrO}_{4}\right)=1.8 \times 10^{-14}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{CrO}_{4}{ }^{2-}\right]$
How much $\mathrm{Pb}^{2+}$ remains in solution when $\mathrm{Ag}^{+}$begins to precipitate (at $2.3 \times 10^{-8} \mathrm{M}$ )?

## Solution

$\left[\mathrm{Pb}^{2+}\right]=\mathrm{K}_{\mathrm{sp}} /\left[\mathrm{CrO}_{4}{ }^{2-}\right]=1.8 \times 10^{-14} / 2.3 \times 10^{-8} \mathrm{M}$ $=7.8 \times 10^{-7} \mathrm{M}$
Lead ion has dropped from 0.020 M to $<10^{-6} \mathrm{M}$

## Formation Constants

Complex lons are systems with Lewis bases connected around the (Lewis) acidic metal center.
Examples: $\mathrm{Zn}\left(\mathrm{NH}_{3}\right)_{4}{ }^{2+}, \mathrm{Ag}(\mathrm{CN})_{2^{-1}}$
Can write a Formation Constant, $\mathrm{K}_{\mathrm{f}}$ $\mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{CN}^{-1}(\mathrm{aq}) \rightleftharpoons \mathrm{Ag}(\mathrm{CN})_{2}{ }^{-1}(\mathrm{aq})$, and
$\mathrm{K}_{\mathrm{f}}=\frac{\left[\mathrm{Ag}(\mathrm{CN})_{2}^{-1}\right]}{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{CN}^{-1}\right]^{2}}=5.6 * 10^{18}$
$\mathrm{K}_{\mathrm{f}}$ values usually quite large (product-favored) and product is always the complex ion

## Formation Constants

Complex lons can be helpful when dissolving solids. $\mathrm{Ex}: \mathrm{AgCl}(\mathrm{s})$ and $\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}(\mathrm{aq})$ $\mathrm{AgCl}(\mathrm{s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}(\mathrm{aq}) \quad \mathrm{K}_{\mathrm{sp}}$ $\mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{aq}) \rightleftharpoons \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}(\mathrm{aq}) \quad \mathrm{K}_{\mathrm{f}}$

 solubility

1. Predict whether each of the following is insoluble or soluble in water: $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}, \mathrm{ZnSO}_{4}$, $\mathrm{NiS}, \mathrm{BaSO}_{4}$
2. When 1.55 g of solid thallium(I) bromide is added to 1.00 L of water, the salt dissolves to a small extent: $\operatorname{TIBr}(\mathrm{s}) \rightleftarrows \mathrm{Tl}^{+}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq})$ The salt dissolves to a small extent: $\mathrm{TiBr}(\mathrm{s}) \rightleftarrows \mathrm{TI}^{+}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq}) \mathrm{Th}$ concentration of $1.9 \times 10^{-3} \mathrm{M}$. What is the value of $K_{\text {sp }}$ for TIBr ?
You add 0.979 g of $\mathrm{Pb}(\mathrm{OH})_{2}$ to 1.00 L of pure water at $25^{\circ} \mathrm{C}$. The pH is 9.15. Estimate the value of $K_{\text {sp }}$ for $\mathrm{Pb}(\mathrm{OH})_{2}$

Estimate the solubility of calcium fluoride $\mathrm{CaF},(\mathrm{a})$ in Coles liter and Estimate the solubility of calcium (b) in grams per liter of pure water. $\quad \mathbf{C a F}_{2}(\mathbf{s}) \rightleftarrows \mathbf{C a}^{2+}(\mathbf{a q})+\mathbf{2}$
$F\left(\right.$ aq) $K_{\text {sp }}=5.3 \times 10$
5. The $K_{\mathrm{sp}}$ value for radium sulfate, $\mathrm{RaSO}_{4}$, is $3.7 \times 10^{-11}$. If 0.25 mg of radium sulfate is placed in $1.00 \times 10^{2} \mathrm{~mL}$ of water, does all of it dissolve? If not, how much dissolves? $\mathrm{RaSO}_{4}(\mathbf{s}) \rightleftarrows \mathrm{Ra}^{2+}(\mathrm{aq})+\mathrm{SO}_{4^{-2}}(\mathrm{aq})$
6. Which compound is more soluble: $\mathrm{PbCl}_{2}\left(K_{\text {sp }}=1.7 \times 10^{-5}\right)$ or $\mathrm{PbBr}_{2}\left(K_{\text {sp }}=\right.$ $\left.6.6 \times 10^{-6}\right)$ ?

## Chemical Thermodynamics Chapter 16

Chemistry 223
Professor Michael Russell
Last update:

## First Law of Thermodynamics

First Law of Thermodynamics: "Energy cannot be created or destroyed" - conservation of energy

The total energy of the universe cannot change
though you can transfer it from one place to another
$\Delta \mathrm{E}_{\text {universe }}=0=\Delta \mathrm{E}_{\text {system }}+\Delta \mathrm{E}_{\text {surroundings }}$
$\Delta \mathrm{E}$ lost or gained through heat ( $q$ ) and/or work (w)

Chemists focus on heat more than work; heat at constant pressure equals enthalpy ( $\Delta \mathrm{H}$ )

## Spontaneous Reactions

Thermodynamics asks if a reaction will occur under the given conditions; if it does, system is favored to react - a product-favored system ( $\mathrm{K}>1$ ) - called a spontaneous reaction
Most product-favored reactions are exothermic ( $\Delta \mathbf{H}$ ) ... but not all.
Nonspontaneous reactions require energy input to occur. All reactions require activation energy ( $\mathrm{E}_{\mathrm{a}}$ ) to take place Spontaneity does not imply anything about time for the reaction to occur (i.e. kinetics). Spontaneity can be for fast and slow reactions!

Enthalpy - CH 221 flashback!
Enthalpy, $\Delta \boldsymbol{H}$, generally in $\mathrm{kJ} / \mathrm{mol}$
If products more stable than reactants, energy released exothermic and $\Delta H=$ negative
If reactants more stable than products, energy absorbed endothermic and $\Delta H=$ positive
Review Hess' Law, $\Delta \boldsymbol{H}^{\circ}{ }_{\text {rxn }}=\Sigma\left(\Delta \boldsymbol{H}_{\text {prod }}^{\circ}\right)-\Sigma\left(\Delta H_{\text {react }}^{\circ}\right)$, bond enthalpies

## Thermodynamics and Kinetics

## Spontaneous Processes

Processes that are spontaneous in one direction are nonspontaneous in the reverse direction.

## Thermodynamics and Kinetics

Diamond is thermodynamically favored to convert to graphite, but not kinetically favored.

Paper burns - a productfavored reaction. Also kinetically favored once reaction is begun.

Both reactions are spontaneous!

## Reversible Processes

In a reversible process the system changes in such a way that the system and surroundings can be put back in their original states by exactly reversing the process.
quite rare in the "real world"...

## Directionality of Reactions

How probable is it that reactant molecules will react (i.e. be spontaneous)?
PROBABILITY suggests that a product-favored reaction will result in the dispersal

- of energy
- of matter, or
- of both energy and matter MAR

MAR

## Spontaneous Processes

Processes that are spontaneous at one temperature may be nonspontaneous at other temperatures.
Above $0^{\circ} \mathrm{C}$ it is spontaneous for ice to melt.
Below $0^{\circ} \mathrm{C}$ the reverse process is spontaneous.

## Irreversible Processes

Irreversible processes cannot be undone by exactly reversing the change to the system.
Spontaneous processes are irreversible

## Directionality of Reactions

Probability suggests that a product-favored reaction will result in the dispersal of energy or of matter or both.
Energy Dispersal

## Product-Favored Reactions

The Thermite Reaction

In general, spontaneous or product-favored reactions are exothermic.
$\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+2 \mathrm{Al}(\mathrm{s})$--> $2 \mathrm{Fe}(\mathrm{s})+\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})$
$\Delta \mathrm{H}=-848 \mathrm{~kJ}$

## Entropy,

One property common to productfavored processes is that the final state is more disordered or random than the original.

Spontaneity is related to an increase in randomness and the thermodynamic property related to randomness is ENTROPY, S.

Reaction of $K$ with water

## Entropy and Microstates

Entropy, S
More disordered substances have higher entropy, so:

$$
\mathrm{S} \text { (solids) < S (liquids) < S (gases) }
$$

Only pure (element), perfectly formed crystals at 0 K have zero entropy ( $S=k \ln W$ where $W=1$ : the 3rd Law of Thermodynamics)
See the Entropy Guide

## Entropy and States of Matter

## Entropy, S

## Entropy of a substance increases with temperature.

Molecular motions of heptane, $\mathrm{C}_{7} \mathrm{H}_{16}$

## Entropy, S

Entropies of ionic solids depend on coulombic attractions.

## Entropy, S

Entropy usually increases when a pure liquid or solid dissolves in a solvent.

See the Entropy Guide

## CH 221 / CH 222 "Enthalpy Flashback"

For a temperature change in the same phase ( $\mathbf{s}, \mathrm{l}, \mathrm{g}$ ) enthalpy ( $\Delta \mathrm{H}$ ) equals the heat transferred (q) at constant pressure via:

$$
\Delta \mathbf{H}=\mathbf{q}=\mathbf{m C} \Delta \mathbf{T}
$$

$m=$ mass (g), C = heat capacity (4.184 $\mathrm{J} \mathrm{g}^{-1} \mathrm{~K}^{-1}$ for water!), $\Delta T=$ final temperature - initial temperature

For a phase change, the enthalpy change: $\Delta \mathrm{H}=$ ("mass")("heat of something")
"mass" = grams or moles, "heat of something" depends on phase change, i.e. $333 \mathrm{~J} / \mathrm{g}=$ heat of fusion, 40.7 $\mathrm{kJ} / \mathrm{mol}=$ heat of vaporization

## Entropy Changes for Phase Changes

For a phase change,
$\Delta S=q / T$
where $q=$ heat transferred in phase change
For $\mathrm{H}_{2} \mathrm{O}$ (liq) ---> $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$, $\quad 40.7 \mathrm{~kJ} / \mathrm{mol}$ is $\Delta \mathbf{H}=\mathbf{q}=+\mathbf{4 0 , 7 0 0} \mathrm{J} / \mathrm{mol} \quad \Delta H_{\text {vap }}$ for $\mathrm{H}_{2} \mathrm{O}$
$\Delta \mathrm{S}=\frac{\mathrm{q}}{\mathrm{T}}=\frac{40,700 \mathrm{~J} / \mathrm{mol}}{373.15 \mathrm{~K}}=+109 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$

## Standard Molar Entropies

Table 19.1 - Some Standard Molar Entropy Values at 298 K

| Element | Entropy, $S^{\circ}$ ( $\mathrm{J} / \mathrm{K} \cdot \mathrm{mol}$ ) | Compound | Entropy, $5^{\circ}$ <br> ( $\mathrm{J} / \mathrm{K} \cdot \mathrm{mol}$ ) |
| :---: | :---: | :---: | :---: |
| C(graphite) | 5.6 | $\mathrm{CH}_{4}(\mathrm{~g})$ | 186.3 |

## Entropy Changes for a Temperature

 Change in the Same PhaseFor a temperature change in the same phase,

|  | $\Delta S=n C \ln \frac{T_{2}}{T_{1}}$ |
| ---: | :--- |
| where $\quad$ | $n=$ moles of substance |
|  | $\mathrm{C}=$ molar heat capacity (at const. P ) |
| $\mathrm{T}=$ Kelvin Temperature |  |

For 0.499 mol of $\mathrm{H}_{2} \mathrm{O}$ heated from 281 K to 294 K : $\mathrm{C}=4.184 \mathrm{~J} \mathrm{~g}^{-1} \mathrm{~K}^{-1}$ * $18.02 \mathrm{~g} \mathrm{~mol}^{-1}=\mathbf{7 5 . 4 0} \mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}$ $\Delta \mathrm{S}=0.499 \mathrm{~mol}^{*} 75.40 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$ * $\ln (294 / 281)$

$$
\Delta \mathrm{S}=1.70 \mathrm{~J} \mathrm{~K}^{-1}
$$

Entropy and Temperature

## CH 221 / CH 222 "Enthalpy Flashback"

Also: the system enthalpy for a reaction can be calculated:
$\Delta \mathbf{H}_{\text {sys }}{ }^{\circ}=\Sigma \Delta \mathrm{H}^{\circ}$ (products) $-\Sigma \Delta \mathrm{H}^{\circ}$ (reactants)

Find $\Delta H_{\text {sys }}{ }^{\circ}$ for: $2 \mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})-->2 \mathrm{H}_{2} \mathrm{O}$ (liq)
$\Delta H^{\circ}=2 \Delta H^{\circ}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right)-\left[2 \Delta \mathrm{H}^{\circ}\left(\mathrm{H}_{2}\right)+\Delta \mathrm{H}^{\circ}\left(\mathrm{O}_{2}\right)\right]$
$\Delta \mathrm{H}^{\circ}=2 \mathrm{~mol}(-285.85 \mathrm{~kJ} / \mathrm{mol})-[2 \mathrm{~mol}(0)+1 \mathrm{~mol}(0)]$
$\Delta \mathbf{H}_{\text {sys }}{ }^{\circ}=\mathbf{- 5 7 1 . 7 0 \mathrm { kJ } / \mathrm { mol }}$
$\Delta H$ for pure elements $=0$. Values of $\Delta H$ found in tables This reaction is exothermic due to negative $\Delta H$ value (endothermic = positive $\Delta H$ ). The "o" means "standard conditions" (298 K, $1 \mathrm{~atm}, 1$ M, most common state)

## Calculating $\Delta \mathbf{S}_{f}{ }^{\circ}$ for a Reaction

$\Delta \mathbf{S}_{f} 0$ is the "entropy of formation" or "formation entropy" (which is similar to CH 221 's "enthalpy of formation", $\Delta \boldsymbol{H}_{f}{ }^{\circ}$ ); this means:

* only one mole of product will be formed
* all reactants are elements in their standard states

Example: Calculate $\Delta S_{f^{\circ}}$ for: $\mathbf{H}_{\mathbf{2}}(\mathrm{g})+1 / 2 \mathrm{O}_{\mathbf{2}}(\mathrm{g})$---> $\mathrm{H}_{\mathbf{2}} \mathrm{O}$ (liq)
Must use fraction - only 1 mol of product! Use standard element states for reactants. Use So values in tables:
$\Delta S_{\mathrm{f}}{ }^{\circ}=\mathrm{S}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right)-\left[\mathrm{S}^{\circ}\left(\mathrm{H}_{2}(\mathrm{~g})\right)+1 / 2 \mathrm{~S}^{\circ}\left(\mathrm{O}_{2}(\mathrm{~g})\right)\right]$
$\Delta \mathbf{S}^{\circ}=69.9 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}-[130.7 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}+1 / 2(205.3 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol})]$
$\Delta S_{f}{ }^{\circ}=-163.5 \mathrm{~J} / \mathrm{K}$

## MAR

## 2nd Law of Thermodynamics

Dissolving $\mathrm{NH}_{4} \mathrm{NO}_{3}$ in water - an entropy driven process: $\mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s}) \rightarrow \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{aq})$

2nd Law of Thermodynamics

$$
\begin{aligned}
& \text { Calculate } \Delta \mathbf{S o}_{\text {universe }} \text { for: } 2 \mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})--->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{liq}) \\
& \Delta \mathrm{S}_{\text {system }}=-326.9 \mathrm{~J} / \mathrm{K}(\text { earlier example for } \Delta \mathrm{S}) \\
& \Delta \mathrm{S}_{\text {surroundings }}^{o}=\frac{\mathrm{q}_{\text {surroundings }}}{\mathrm{T}}=\frac{-\Delta \mathrm{H}_{\text {system }}}{\mathrm{T}}
\end{aligned}
$$

Can calculate that $\Delta \mathrm{H}^{\circ}$ system $=\mathbf{- 5 7 1 . 7 0 \mathrm { kJ }}$
via $\Delta H^{\circ}($ system $)=\Sigma \Delta H^{\circ}($ prod $)-\Sigma \Delta H^{\circ}($ react $)$ $\Delta H o($ system $)=2^{*} \Delta H^{\circ}\left(H_{2} \mathrm{O}\right)-\left(2^{*} \Delta H^{\circ}\left(H_{2}\right)+\Delta H^{\circ}\left(\mathrm{O}_{2}\right)\right)$
$\Delta \mathrm{S}_{\text {surroundings }}^{\mathrm{o}}=\frac{-(-571.70 \mathrm{~kJ})(1000 \mathrm{~J} / \mathrm{kJ})}{298.15 \mathrm{~K}}$

Calculating $\Delta \mathbf{S}$ for a Reaction<br>$\Delta \mathbf{S}_{\text {sys }}{ }^{\circ}=\Sigma \mathbf{S}^{\circ}$ (products) $-\Sigma \mathbf{S}^{\circ}$ (reactants)<br>$\Delta S_{\text {sys }}{ }^{\circ}=$ "system entropy at standard conditions"<br>Calculate $\Delta \mathrm{S}_{\text {sys }}$ : $2 \mathrm{H}_{\mathbf{2}}(\mathrm{g})+\mathbf{O}_{\mathbf{2}}(\mathrm{g})$---> $\mathbf{2} \mathbf{H}_{\mathbf{2}} \mathbf{O}$ (liq)<br>Use So values in tables:<br>$\Delta S^{\circ}=2 \mathrm{~S}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right)-\left[2 \mathrm{~S}^{\circ}\left(\mathrm{H}_{2}(\mathrm{~g})\right)+\mathrm{S}^{\circ}\left(\mathrm{O}_{2}(\mathrm{~g})\right)\right]$<br>$\Delta S \circ=2 \mathrm{~mol}(69.9 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol})-[2 \mathrm{~mol}(130.7 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol})$<br>$+1 \mathrm{~mol}(205.3 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol})]$<br>$\Delta S_{\text {sys }}{ }^{\circ}=-326.9 \mathrm{~J} / \mathrm{K}$<br>Note that there is a decrease in S because 3 mol of gas give 2 mol of liquid.

## 2nd Law of Thermodynamics

A reaction is spontaneous (product-favored) if $\Delta \mathbf{S}$ for the universe is positive.
$\Delta \mathbf{S}_{\text {universe }}=\Delta \mathbf{S}_{\text {system }}+\Delta \mathbf{S}_{\text {surroundings }}$
$\Delta \mathrm{S}_{\text {universe }}>0$ (positive) for all productfavored irreversible process

First calc. entropy created by matter dispersal
( $\Delta \mathbf{S}_{\text {system }}$ )
Next, calc. entropy created by energy dispersal
( $\Delta \mathbf{S}_{\text {surround }}$ )
MAR

Remember that $-\Delta \mathrm{H}_{\text {sys }}$ is proportional to $\Delta \mathrm{S}_{\text {surr }}$
An exothermic process has $\Delta \mathrm{S}_{\text {surr }}>0$.
MAR

## Gibbs Free Energy, G

$$
\begin{aligned}
& \Delta S_{\text {univ }}=\Delta S_{\text {surr }}+\Delta S_{\text {sys }} \\
& \Delta S_{\text {univ }}=\frac{-\Delta H_{\text {sys }}}{T}+\Delta S_{\text {sys }}
\end{aligned}
$$

Multiply through by -T
 $-T \Delta \mathbf{S}_{\text {univ }}=\Delta \mathbf{H}_{\text {sys }}-\mathbf{T} \Delta \mathbf{S}_{\text {sys }}$
$-T \Delta S_{\text {univ }}=$ change in Gibbs free energy for the system $=\Delta \mathbf{G}_{\text {system }}$
Under standard conditions -
$\Delta \mathbf{G}^{\circ}=\Delta \mathrm{H}^{\circ}-\mathrm{T} \Delta \mathbf{S}^{\circ}$
See the Gibbs Free Energy Guide

## $\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}$

Gibbs free energy change =
total energy change for system

- energy lost in disordering the system

If reaction is

- endothermic (positive $\Delta \mathbf{H}^{\mathbf{o}}$ )
- and entropy decreases (negative $\Delta S^{\circ}$ )
then $\Delta \mathbf{G}^{\mathbf{0}}$ must be POSITIVE
Reaction is not spontaneous (and is reactant-favored).

| Type | $\Delta H_{\text {sys }}^{\circ}$ | $\Delta S_{\text {sys }}^{\circ}$ | Spontaneous Process? |
| :--- | :--- | :--- | :--- |
| 1 | Exothermic process | Less order | Spontaneous under all conditions |
|  | $\Delta H_{s y s}<0$ | $\Delta S_{s y s}^{\circ}>0$ | $\Delta S_{\text {iniv }}^{\circ}>0$ |
| 2 | Exothermic process | More order | Depends on relative magnitudes of $\Delta H$ and $\Delta S$ |
|  | $\Delta H_{\text {sys }}<0$ | $\Delta S_{\text {sys }}^{\circ}<0$ | More favorable at lower temperatures |
| 3 | Endothermic process | Less order | Depends on relative magnitudes of $\Delta H$ and $\Delta S$ |
|  | $\Delta H_{\text {sys }}>0$ | $\Delta S_{\text {sys }}>0$ | More favorable at higher temperatures |
| 4 | Endothermic process | More order | Not spontaneous under all conditions |
|  | $\Delta H_{\text {sys }}>0$ | $\Delta S_{\text {sys }}^{\circ}<0$ | $\Delta S_{\text {univ }}^{\circ}<0$ |

## Spontaneous or Not?

## $\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}$

Gibbs free energy change =
total energy change for system

- energy lost in disordering the system

If reaction is

- exothermic (negative $\Delta \mathbf{H}^{\circ}$ ) (energy dispersed)
- and entropy increases (positive $\Delta \mathbf{S O}^{\circ}$ ) (matter dispersed)
then $\Delta G^{0}$ must be NEGATIVE
Reaction is spontaneous (and productfavored).

MAR

## Gibbs Free Energy, G

| $\Delta \mathbf{G o}$ | $=\Delta \mathbf{H o}-$ | $\mathbf{T} \Delta \mathbf{S o}$ |  |
| :--- | :--- | :---: | :--- |
| $\Delta \mathbf{H}^{\circ}$ | $\Delta \mathbf{S o}$ | $\Delta \mathbf{G} \circ$ | Reaction |
| exo(-) | increase(+) | - | Prod-favored |
| endo(+) | decrease(-) | + | React-favored |
| exo(-) | decrease(-) | $?$ | T dependent |
| endo(+) | increase(+) | $?$ | T dependent |
|  | spontaneous means product favored and <br> implies a negative $\Delta G$ <br> non-spontaneous means reactant favored <br> and implies a positive $\Delta G$ |  |  |

Table 19.2 - Predicting if a Process Is Spontaneous

## Gibbs Free Energy, G

$$
\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}
$$

Two methods for calculating $\Delta \mathbf{G}^{\circ}$
a) Determine $\Delta \mathrm{H}^{\circ}{ }_{\mathrm{rxn}}$ and $\Delta \mathrm{S}^{\circ}{ }_{\mathrm{rxn}}$ and use Gibbs equation.
b) Use tabulated values of free energies of formation, $\Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}$.
$\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=\sum \Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}$ (products) $-\sum \Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}$ (reactants)
See the Gibbs Free Energy Guide

## Calculating $\Delta \mathbf{G}^{{ }^{r} \times n}$

Example: Find $\Delta \mathbf{G}^{\circ}{ }_{r \times n}$ for the combustion of acetylene:
$\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+5 / 2 \mathrm{O}_{2}(\mathrm{~g})-->2 \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

* Use enthalpies of formation to calculate

$$
\Delta H^{\circ}{ }_{\mathrm{rxn}}=-1238 \mathrm{~kJ} \quad \Delta H^{\circ}(r x n)=\Sigma \Delta H^{\circ}(\text { prod })-\Sigma \Delta H^{\circ}(\text { react })
$$

* Use standard molar entropies to calculate

* $\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=-1238 \mathrm{~kJ}-(298 \mathrm{~K})(-0.0974 \mathrm{~kJ} / \mathrm{K})$
$=-1209 \mathrm{~kJ}$
Reaction is product-favored despite negative $\Delta \mathbf{S}^{\circ}{ }_{r x n}$. Reaction is "enthalpy driven"
C (graphite) $+\mathrm{O}_{2}(\mathrm{~g})-->\mathrm{CO}_{2}(\mathrm{~g})$
$\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=\Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}\left(\mathbf{C O}_{2}\right)-\left[\Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}(\mathbf{g r a p h})+\Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}\left(\mathrm{O}_{2}\right)\right]$
$\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=-394.4 \mathrm{~kJ}-[0+0]$
$\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=-394.4 \mathrm{~kJ}$
Note that free energy of formation of an element in its standard state is 0 .
Reaction is product-favored as expected - green house gases!

Free Energies of Formation
$\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=\sum \Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}$ (products) $-\sum \Delta \mathbf{G}_{\mathrm{f}}{ }^{\circ}$ (reactants)

| Element/Compound | $\Delta G_{f}^{\circ}\left(\mathrm{kJ} \cdot \mathrm{mol}^{-1}\right)$ | Element/Compound | $\Delta G_{f}^{\circ}\left(\mathbf{k J} \cdot \mathrm{mol}^{-1}\right)$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{H}_{2}(\mathrm{~g})$ | 0 | $\mathrm{CO}_{2}(\mathrm{~g})$ | -394.4 |
| $\mathrm{O}_{2}(\mathrm{~g})$ | 0 | $\mathrm{CH}_{4}(\mathrm{~g})$ | -50.87 |
| $\mathrm{N}_{2}(\mathrm{~g})$ | 0 | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | -228.6 |
| C(graphite) | 0 | $\mathrm{H}_{2} \mathrm{O}(\ell)$ | -237.2 |
| c(diamond) | 2.900 | $\mathrm{NH}_{3}(\mathrm{~g})$ | -16.4 |
| CO(9) | -137.2 | $\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})$ | -742.2 |

Note that $\Delta \mathbf{G}^{\circ}$ for an element $=\mathbf{0}$

## Calculating $\Delta \mathbf{G}^{{ }^{\text {rxn }}}$

Some reactions occur spontaneously due to favorable $\Delta \mathrm{H}^{\mathrm{r} x n}$ and $\Delta \mathbf{S}_{{ }_{r x n}}$ values.
These reactions are both "enthalpy driven" and "entropy driven"

But not all reactions have favorable enthalpy and entropy values..

Calculating $\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}$<br>Find $\Delta G^{\circ}{ }_{r x n}: \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s})+$ heat $-->\mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{aq})$

From tables of thermodynamic data we find

$$
\begin{aligned}
\Delta \mathbf{H}^{\circ}{ }_{r \times n} & =+25.7 \mathrm{~kJ} \quad \Delta H^{\circ}(r x n)=\Sigma \Delta H^{\circ}(\text { prod })-\Sigma \Delta H^{\circ}(r e a c t) \\
\Delta S^{\circ}{ }^{\mathrm{rxn}} & =+108.7 \mathrm{~J} / \mathrm{K} \text { or }+\mathbf{+ 0 . 1 0 8 7 \mathrm { kJ } / \mathrm { K } \quad \text { ditto for } \Delta S ^ { \circ } ( r x n )} \\
\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}} & =+25.7 \mathrm{~kJ}-(298 \mathrm{~K})(+0.1087 \mathrm{~kJ} / \mathrm{K}) \\
& =-6.7 \mathrm{~kJ}
\end{aligned}
$$

Reaction is product-favored in spite of positive $\Delta \mathbf{H}^{\circ}{ }_{r \times n}$. Reaction is "entropy driven"

```
\(2 \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+3 \mathrm{C}(\mathrm{s})-->4 \mathrm{Fe}(\mathrm{s})+3 \mathrm{CO}_{2}(\mathrm{~g})\)
\(\Delta \mathrm{H}^{\circ}{ }_{\mathrm{rxn}}=+467.9 \mathrm{~kJ} \quad \Delta \mathrm{~S}_{\mathrm{rxn}}=+560.3 \mathrm{~J} / \mathrm{K}\)
\(\Delta G^{\circ}{ }_{\mathrm{rxn}}=+300.8 \mathrm{~kJ}\)
```

Reaction is reactant-favored at 298 K
At what Threshold Temperature does $\Delta \mathbf{G}^{\circ}{ }_{r \times n}$ just change from being (+) to being (-)?
When $\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=\mathbf{0}=\Delta \mathbf{H}_{\mathrm{rxn}}-\mathrm{T} \Delta \mathbf{S}^{\circ}{ }_{\mathrm{rxn}}$
If $\Delta \mathrm{H}$ and $\Delta \mathrm{S}$ have the
$\mathrm{T}=\frac{\Delta \mathrm{H}_{\mathrm{rxn}}}{\Delta \mathrm{S}_{\mathrm{rxn}}}=\frac{467.9 \mathrm{~kJ}}{0.5603 \mathrm{~kJ} / \mathrm{K}}=835.1 \mathrm{~K}$ same sign, calculating the Threshold Temperature (between spontaneous and nonspontaneous reactions) can be important!

Free Energy and Equilibrium
$\mathrm{K}_{\text {eq }}$ is related to reaction favorability and $\Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}$ The more negative the value of $\Delta \mathbf{G}^{\circ}{ }_{r \times n}$ the larger the value of K .

$$
\Delta G^{\circ}{ }_{\mathrm{rxn}}=-\mathrm{RT} \operatorname{In} \mathrm{~K}
$$

where $\mathbf{R}=8.3145 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$
If not at standard states (i.e $\Delta \mathbf{G}_{\mathrm{rxn}}$ ) then:

$\Delta \mathbf{G}_{\mathrm{rxn}}=\Delta \mathbf{G}_{\mathrm{rxn}}+\mathbf{R T} \operatorname{In} \mathbf{Q}$
Find $\Delta G^{\circ}{ }_{r x n}$ with $K$ first, then solve for $\Delta G_{r x n}$
MAR
See the Gibbs Free Energy Guide

## Thermodynamics and $\mathrm{K}_{\text {eq }}$

$$
\Delta \mathbf{G o}_{\mathrm{rxn}}=-\mathbf{R T} \ln \mathrm{K}
$$

Calculate K for the reaction:

$$
\begin{aligned}
& \mathrm{N}_{2} \mathrm{O}_{4}--->2 \mathrm{NO}_{2} \quad \Delta \mathbf{G}^{\circ} \mathrm{rxn}=+4.80 \mathrm{~kJ} \\
& \Delta \mathbf{G}^{\circ}{ }_{\mathrm{rxn}}=+4800 \mathrm{~J}=-(8.3145 \mathrm{~J} / \mathrm{K})(298 \mathrm{~K}) \operatorname{ln~K}
\end{aligned}
$$

$$
\ln K=-\frac{4800 \mathrm{~J}}{(8.3145 \mathrm{~J} / \mathrm{K})(298 \mathrm{~K})}=-1.94
$$

$$
K=e^{-1.94}=0.14
$$

When $\Delta G^{\circ}{ }_{r x n}>0$, then $\mathrm{K}<1$

Another example:
$\mathrm{H}_{2} \mathrm{O}(s) \rightarrow \mathrm{H}_{2} \mathrm{O}(I)$ at 273 K
$\Delta H=$ positive
$\Delta S=$ positive
$\Delta G=\Delta H-T \Delta S$
= negative above a certain temperature, when $T \Delta S>\Delta H$

$\Delta \mathbf{G}^{\circ}=\Delta \mathbf{H}^{\circ}-\mathbf{T} \Delta \mathbf{S}^{\circ}$
$\Delta G^{\circ}{ }_{\mathrm{rxn}}=-\mathrm{RT} \ln \mathrm{K}$
$R=8.3145 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
$\Delta \mathbf{G}_{\mathrm{rxn}}=\Delta \mathbf{G}_{\mathrm{r} \times \mathrm{n}}+\mathrm{RT} \ln \mathbf{Q}$

Handouts:

- Types of Equilibrium Constants
- Thermodynamic Values (Problem Set \#5)

## End of Chapter Problems: Answers

1. $93.3 \mathrm{~J} / \mathrm{K}$
2. $\Delta H^{\circ}=191.59 \mathrm{~kJ}, \Delta \mathrm{~S}^{\circ}=141.9 \mathrm{~J} / \mathrm{K}, \Delta \mathrm{G}^{\circ}=149.3 \mathrm{~kJ}(298 \mathrm{~K})$, not spontaneous, but reaction should be spontaneous at higher temperatures (entropy driven)
3. $\Delta G^{\circ}{ }_{\text {rn }}=-817.0 \mathrm{~kJ}$, spontaneous
4. $\mathrm{T}=2089 \mathrm{~K}$ and greater
5. $\Delta G^{\circ}=-83.74 \mathrm{~kJ}$, and $K_{p}=4.8 \times 10^{14}$ product favored

You will need a table of thermodynamic values found in problem set \#5

## End of Chapter Problems: Test Yourself

You will need a table of thermodynamic values found in problem set \#5

1. Use $S^{\circ}$ values to calculate the entropy change, $\Delta S^{\circ}$, for the following
2. Calculate $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for the reaction: $\mathrm{CaCO}_{3}(\mathbf{s}) \rightarrow \mathbf{C a O}(\mathbf{s})+\mathrm{CO}_{2}$ (g) Is the reaction predicted to be spontaneous at room temperature? higher temperatures?
3. Using values of $\Delta G^{\circ}{ }_{f}$, calculate $\Delta G^{\circ}{ }_{r \times n}$ for: $\mathbf{2} \mathbf{K}(\mathbf{s})+\mathbf{C l}_{2}(\mathbf{g}) \rightarrow \mathbf{2} \mathbf{K C l}(\mathbf{s})$
4. Estimate the temperature required to decompose $\mathrm{HgS}(\mathrm{s}$, red) into $\mathrm{Hg}(\mathrm{l})$ and $\mathrm{S}(\mathrm{g})$.
5. Calculate $\Delta G^{\circ}$ and $K_{\mathrm{p}}$ at $25^{\circ} \mathrm{C}$ for the reaction: $2 \mathrm{HBr}(\mathrm{g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2$ $\mathrm{HCl}(\mathrm{g})+\mathrm{Br}_{2}(\mathrm{I})$ Is the reaction predicted to be product-favored under standard conditions?

ELECTROCHEMISTRY

## OXIDATION-REDUCTION REACTIONS

Direct Redox Reaction
Oxidizing and reducing agents in direct contact.
$\mathrm{Cu}(\mathrm{s})+2 \mathrm{Ag}^{+}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{Ag}(\mathrm{s})$

## OXIDATION-REDUCTION REACTIONS

Indirect Redox Reaction
A battery functions by transferring electrons through an external wire from the reducing agent to the oxidizing agent.

Why Study Electrochemistry?

## Electrochemical Cells

An apparatus that allows a redox reaction to occur by transferring electrons through an external connector.
Product favored reaction ---> voltaic or galvanic cell ----> electric current created
Reactant favored reaction ---> electrolytic cell ---> electric current used to cause chemical change

Batteries are voltaic cells

Famous Electrochemists

## Balancing Equations for Redox Reactions

Some redox reactions have equations that must be balanced by special techniques.

$\mathrm{MnO}_{4}{ }^{-}+5 \mathrm{Fe}^{2+}+8 \mathrm{H}^{+}$
$\mathrm{Mn}=+7 \quad \mathrm{Fe}=+\mathbf{+}$
$\rightarrow \mathrm{Mn}^{2+}+5 \mathrm{Fe}^{3+}+4 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{Mn}=+2 \quad \mathrm{Fe}=+3$
MAR

## Balancing Equations

## Balancing Equations

Step 4: Multiply each half-reaction by a factor that means the reducing agent supplies as many electrons as the oxidizing agent requires.
Reducing agent $\mathrm{Cu} \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{e}-$
Oxidizing agent $2 \mathrm{Ag}^{+}+2 \mathrm{e}-\longrightarrow 2 \mathrm{Ag}$
Step 5: Add half-reactions to give the overall equation.

$$
\mathrm{Cu}+2 \mathrm{Ag}^{+} \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{Ag}
$$

The equation is now balanced for both charge and mass.

## Balancing Equations

Step 3: Balance half-reactions for charge.
Ox $\quad \mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}}+\mathbf{2 e} \mathbf{e}$
Red $\quad \mathrm{e}-+2 \mathrm{H}^{+}+\mathrm{VO}_{2}{ }^{+} \rightarrow \mathrm{VO}^{2+}+\mathrm{H}_{2} \mathrm{O}$
Step 4: Multiply by an appropriate factor.
$\mathbf{O x} \quad \mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}}+\mathbf{2 e} \mathbf{e}$
Red $\quad 2 \mathrm{e}-+4 \mathrm{H}^{+}+2 \mathrm{VO}_{2}{ }^{+}$ $\rightarrow 2 \mathrm{VO}^{2+}+2 \mathrm{H}_{2} \mathrm{O}$
Step 5: Add half-reactions

$$
\mathrm{Zn}+4 \mathrm{H}^{+}+2 \mathrm{VO}_{2}^{+} \rightarrow \mathrm{Zn}^{2+}+2 \mathrm{VO}^{2+}+2 \mathrm{H}_{2} \mathrm{O}
$$

Reduction of $\mathrm{VO}_{2}{ }^{+}$with Zn

## Balancing Equations

Balance the following in acidic solution-

$$
\mathrm{VO}_{2}^{+}+\mathrm{Zn} \rightarrow \mathrm{VO}^{2+}+\mathrm{Zn}^{2+}
$$

Step 1: Write the half-reactions
Ox $\quad \mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}}$
Red $\quad \mathrm{VO}_{2}{ }^{+} \longrightarrow \mathrm{VO}^{2+} \quad\left(\mathrm{V}^{5+}-->\mathrm{V}^{4+}\right)$
Step 2: Balance each half-reaction for mass.
Ox $\quad \mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}}$
Red $\quad 2 \mathrm{H}^{+}+\mathrm{VO}_{2}{ }^{+} \rightarrow \mathrm{VO}^{2+}+\mathrm{H}_{2} \mathrm{O}$
Add $\mathrm{H}_{2} \mathrm{O}$ on O-deficient side and add $\mathrm{H}^{+}$on
MAR other side for balancing hydrogen

## Balancing Equations

Balance the following in basic solution-

$$
\mathrm{MnO}_{4}{ }^{1-}+\mathrm{HO}_{2^{-}} \rightarrow \mathrm{MnO}_{4}{ }^{2-}+\mathrm{O}_{2}
$$

Step 1: Write the half-reactions
$\mathrm{Ox} \quad \mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2} \quad$ (peroxide: $\mathrm{O}^{-1} \rightarrow \mathrm{O}^{0}$ )
Red $\quad \mathrm{MnO}_{4}{ }^{1-} \rightarrow \mathrm{MnO}_{4}{ }^{2-}\left(\mathrm{Mn}^{7+} \rightarrow \mathrm{Mn}^{6+}\right)$
Step 2: Balance each half-reaction for mass.
Red $\quad \mathrm{MnO}_{4}{ }^{1-} \longrightarrow \mathrm{MnO}_{4}{ }^{\mathbf{2 -}}$
$\mathrm{Ox} \quad \mathrm{HO}_{2}-\longrightarrow \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}$

Balancing Equations
Balance the following in basic solution-

$$
\mathrm{MnO}_{4}{ }^{1-}+\mathrm{HO}_{2}^{-} \rightarrow \mathrm{MnO}_{4}{ }^{2-}+\mathrm{O}_{2}
$$

Step 1: Write the half-reactions
$\mathrm{Ox} \quad \mathrm{HO}_{2}{ }^{-} \rightarrow \mathrm{O}_{2} \quad$ (peroxide: $\mathrm{O}^{-1} \rightarrow \mathrm{O}^{0}$ )
Red $\quad \mathrm{MnO}_{4}{ }^{1-} \rightarrow \mathrm{MnO}_{4}{ }^{2-}\left(\mathrm{Mn}^{7+} \rightarrow \mathrm{Mn}^{6+}\right)$
Step 2: Balance each half-reaction for mass.
Red $\quad \mathrm{MnO}_{4}{ }^{1-} \rightarrow \mathrm{MnO}_{4}{ }^{\mathbf{2 -}}$
$\mathrm{Ox} \quad \mathrm{OH}^{-}+\mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}$
Add $\mathrm{H}_{2} \mathrm{O}$ on H -deficient side and add $\mathrm{OH}^{-}$on other side for balancing oxygen

Add $\mathrm{H}^{+}$to H -deficient side and $\mathrm{H}_{2} \mathrm{O}$ to balance oxygen

## Alternate Basic Balancing Method

Step 6: $\quad$ Neutralize $\mathrm{H}^{+}$by adding $\mathrm{OH}^{-}$.
$\mathrm{H}^{+}$and OH - make $\mathrm{H}_{2} \mathrm{O}$.
Add OH - to both sides of equation
$\mathrm{HO}_{2}^{-}+2 \mathrm{MnO}_{4}{ }^{1-}+\mathrm{OH}^{-} \rightarrow$
$\mathrm{O}_{2}+\mathrm{H}^{+}+\mathrm{OH}^{-}+2 \mathrm{MnO}_{4}{ }^{2-}$

$$
\begin{aligned}
\mathrm{HO}_{2}^{-}+2 & \mathrm{MnO}_{4}^{1-}+\mathrm{OH} \\
& \rightarrow \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{MnO}_{4}^{2-}
\end{aligned}
$$

Use either method to balance basic redox reactions
Also see the Redox Reactions Handout

## Balancing Equations

Step 3: Balance half-reactions for charge.
$\mathrm{Ox} \quad \mathrm{OH}+\mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-$
Red $\quad \mathrm{e}-+\mathrm{MnO}_{4}{ }^{1-} \rightarrow \mathrm{MnO}_{4}{ }^{2-}$
Step 4: Multiply by an appropriate factor.
$\mathrm{Ox} \quad \mathrm{OH}+\mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-$
Red $\quad 2 \mathrm{e}-+2 \mathrm{MnO}_{4}{ }^{1-} \longrightarrow 2 \mathrm{MnO}_{4}{ }^{2-}$
Step 5: Add half-reactions

$$
\begin{array}{|l}
\hline \mathbf{O H}+\mathbf{H O}_{2^{-}}^{-}+\mathbf{2} \mathbf{M n O}_{4^{1-}} \\
\rightarrow \mathbf{O}_{2}+\mathbf{H}_{2} \mathbf{O}+\mathbf{2} \mathbf{M n O}_{4}{ }^{2-} \\
\text { Add } \mathrm{H}_{2} \mathrm{O} \text { on H-deficient side and add } \mathrm{OH}^{-} \text {on other } \\
\text { side for balancing oxygen in basic solution }
\end{array}
$$

## Alternate Basic Balancing Method

Step 3: Balance half-reactions for charge.
$\mathrm{Ox} \quad \mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2}+\mathrm{H}^{+}+2 \mathrm{e}-$
Red $\quad \mathrm{e}-+\mathrm{MnO}_{4}{ }^{1-} \longrightarrow \mathrm{MnO}_{4}{ }^{2-}$
Step 4: Multiply by an appropriate factor.
$\mathrm{Ox} \quad \mathrm{HO}_{2^{-}} \rightarrow \mathrm{O}_{2}+\mathrm{H}^{+}+2 \mathrm{e}-$
Red $\quad 2 \mathrm{e}-+2 \mathrm{MnO}_{4}{ }^{1-} \rightarrow 2 \mathrm{MnO}_{4}{ }^{2-}$
Step 5: Add half-reactions
$\mathrm{HO}_{2}{ }^{-}+2 \mathrm{MnO}_{4}{ }^{1-} \rightarrow \mathrm{O}_{2}+\mathrm{H}^{+}+2 \mathrm{MnO}_{4}{ }^{2-}$

This equation is balanced for $\mathrm{pH}<7$ but not base

Tips on Balancing Equations

- Determine the pH of the reaction.
- Never add $\mathrm{O}_{2}$, O atoms, or $\mathrm{O}^{2-}$ to balance oxygen.
- Never add $\mathrm{H}_{2}$ or H atoms to balance hydrogen.
- Be sure to write the correct charges on all the ions.
- Check your work at the end to make sure mass and charge are balanced.
- See: Redox Reactions Handout

## CHEMICAL CHANGE --> ELECTRIC CURRENT

Zn is oxidized and is the reducing agent $\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}-$
$\mathrm{Cu}^{2+}$ is reduced and is the oxidizing agent

## CHEMICAL CHANGE --> <br> ELECTRIC CURRENT

To obtain a useful current, we separate the oxidizing and reducing agents so that electron transfer occurs through an external wire.

This is accomplished in a GALVANIC or VOLTAIC cell.

A group of such cells is called a battery.

Electrons travel through external wire. Salt bridge allows anions and cations to move between electrode compartments, maintaining electrical neutrality.

Salt Bridge

A Red Cat and An Ox

can also be written as:

An Ox = OXidation at the ANode $\mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}} \boldsymbol{+} \mathbf{2 e} \mathbf{-}$
also remember:
oxidation $=$ reducing agent reduction $=$ oxidizing agent

## SHORTHAND NOTATION for GALVANIC CELLS

$$
\mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s})
$$

## SHORTHAND NOTATION for GALVANIC CELLS <br> Example: Describe the following galvanic cell:

$\mathrm{Cu}(\mathrm{s})\left|\mathrm{Cu}^{2+}(1.0 \mathrm{M})\right|\left|\mathrm{Cl}_{2}(1.0 \mathrm{~atm})\right| \mathrm{Cl}(1.0 \mathrm{M}) \mid \mathrm{Pt}(\mathrm{s})$
Solution:
The anode (oxidation) is: $\mathbf{C u}(\mathbf{s}) \rightarrow \mathrm{Cu}^{2+}{ }_{(\text {aq) }}+2 \mathrm{e}-$ and $\left[\mathrm{Cu}^{2+}\right]=1.0 \mathrm{M}$
The cathode (reduction) is: $\mathbf{C l}_{\mathbf{2}}(\mathbf{g})+\mathbf{2} \mathbf{e} \rightarrow \mathbf{2} \mathbf{C l}_{(\text {(aq) }}$ and $[\mathrm{Cl}-]=1.0 \mathrm{M}$ and $\mathrm{P}\left(\mathrm{Cl}_{2}\right)=1.0 \mathrm{~atm}$

The cathode uses a Platinum electrode to transfer electrons to the $\mathrm{Cl}_{2(\mathrm{~g})}$. The Pt does not react chemically with the electrons

## CELL POTENTIAL, E

> Electrons are "driven" from anode to cathode by an electromotive force or emf.
> For $\mathrm{Zn} / \mathrm{Cu}$ cell, this is indicated by a voltage of 1.10 V at $25^{\circ} \mathrm{C}$ and when $\left[\mathrm{Zn}^{2+}\right]$ and $\left[\mathrm{Cu}^{2+}\right]=1.0$ M.

Sign of Battery Terminals (Galvanic Cells Only)

MAR

Water only spontaneously flows one way in a waterfall.
Likewise, electrons only spontaneously flow one way in a redox reactionfrom higher to lower potential energy.

## Electromotive Force (emf)

## Calculating Cell Voltage

Balanced half-reactions can be added together to get overall, balanced equation.

If we know $E^{\circ}$ for each half-reaction, we can calculate $E^{\circ}$ for net reaction.

## CELL POTENTIALS, E

Cannot measure $1 / 2$ reaction E ${ }^{\circ}$ directly.
Therefore, measure it relative to a STANDARD HYDROGEN CELL, SHE.
(SHE = $\underline{S}$ tandard $\underline{H y d r o g e n ~ E l e c t r o d e) ~}$

$$
2 \mathrm{H}+(\mathrm{aq}, 1 \mathrm{M})+2 \mathrm{e}-\rightleftarrows \mathrm{H}_{2}(\mathrm{~g}, 1 \mathrm{~atm})
$$

$$
E^{\circ}=0.00 \mathrm{~V}
$$

MAR

## Zn/SHE half cell

## Zn/SHE half cell

How to find the zinc half cell potential, $\mathrm{E}_{\mathrm{Zn}}{ }^{\circ}$ :

## $\mathrm{Cu} / \mathrm{Cu}^{2+}$ and $\mathrm{H}_{2} / \mathrm{H}^{+} \mathrm{Cell}$

Overall reaction is reduction of $\mathrm{Cu}^{2+}$ by $\mathrm{H}_{2}$ gas.
$\mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{Cu}(\mathrm{s})+2 \mathrm{H}^{+}(\mathrm{aq})$
Measured $\mathrm{E}^{\circ}=+0.34 \mathrm{~V}$
Therefore, $\mathrm{E}^{\circ}$ for $\mathrm{Cu}^{2+}+2 \mathrm{e}-\rightarrow \mathrm{Cu}$ is

MAR
+0.34 V

## Zn/Cu Electrochemical Cell

Anode, negative, source of electrons
 Cathode, positive, sink for electrons

| $\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}-$ | $\mathrm{E}^{\circ}=+0.76 \mathrm{~V}$ |
| :--- | :--- |
| $\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}-\mathrm{Cu}(\mathrm{s})$ | $\mathrm{E}_{0}=+0.34 \mathrm{~V}$ |

$$
\begin{gathered}
\mathrm{Cu}^{2+}(\mathrm{aq})+\underset{\mathrm{Zn}(\mathrm{~s}) \longrightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s})}{\mathrm{E}^{\circ}\left(\mathrm{calc}^{\prime} \mathrm{d}\right)=+1.10 \mathrm{~V}}
\end{gathered}
$$

## Reversing Half Reactions

Reversing half reactions changes the sign but not the magnitude of $E^{\circ}$ values
Example:
$\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}-\quad \mathrm{E}^{\circ}=+0.76 \mathrm{~V}$
would become
$\mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}-\rightarrow \mathrm{Zn}(\mathrm{s}) \quad \mathrm{Eo}=-0.76 \mathrm{~V}$
Because $E^{\circ}$ tables listed as reductions, many negative $E^{\circ}$ values will appear
Negative $E^{\circ}$ values imply great oxidizers / reducing agents
Positive $E^{\circ}$ values imply great reducers / oxidizing agents

Standard Redox Potentials, $\mathrm{E}^{\circ}$

| $\mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}$ | +0.34 |
| :---: | :---: |
| $2 \mathrm{H}^{+}+2 \mathrm{e} \rightarrow \mathrm{H}_{2}$ | 0.00 |
| $\mathrm{Zn}^{2+}+2 \mathrm{e}-$ | -0.76 |

Any substance on the right will reduce any substance higher than it on the left.

Northwest-southeast rule: product-favored reactions occur between reducing agent at southeast corner (anode) and oxidizing agent at northwest corner (cathode).

## Uses of $\mathrm{E}^{\circ}$ Values

 predict the direction of redox reactions.

## Calculating Eo (Michael's Method)

Flip one half-reaction from table (and E' value),
then add oxidation and reduction values
Example: Determine $E^{\cdot}$ for the following:
$2 \mathrm{Al}+3 \mathrm{Ni}^{2+} \rightarrow 2 \mathrm{Al}^{3+}+3 \mathrm{Ni}$
Solution: From redox tables we find:
$\mathrm{Al}^{3+}+3 \mathrm{e}^{-} \rightarrow \mathrm{AlE}=-1.66 \mathrm{~V}$
$\mathrm{Ni}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{NiE}=-0.25 \mathrm{~V}$
$\mathrm{Ni}^{2+}$ ok as written; need to flip $\mathrm{Al}^{3+}$ reaction to:
$\mathrm{Al} \rightarrow \mathrm{Al}^{3+}+3 \mathrm{e}^{-} \mathrm{E}^{\circ}=+1.66 \mathrm{~V}$
So: $E^{\prime}=1.66-0.25=1.41 \mathrm{~V}$

Calculating Eo
Calculate $\mathrm{E}^{\circ}{ }_{\text {net }}$ for reaction between $\mathbf{C u}$ and $\mathrm{Ag}^{+}$ions

$\mathrm{Ag}^{+}+\mathrm{e}^{-} \rightarrow \mathrm{AgE}^{-}=0.80 \mathrm{~V}$
$\mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{CuEE}^{\circ}=0.337 \mathrm{~V}$
$\mathrm{Ag}^{+}$ok as written; need to flip Cu²+ reaction to:
$\mathrm{Cu} \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{e} \mathrm{E}^{\circ}=-\mathbf{0} .337 \mathrm{~V}$
$\mathrm{E}^{\mathrm{n} \text { net }}$ for $\mathrm{Cu} / \mathrm{Ag}+$ reaction $=0.80-0.337=+0.46 \mathrm{~V}$
balanced reaction: $\mathbf{C u}+\mathbf{2} \mathbf{A g}^{+} \rightarrow \mathbf{2 ~ A g}+\mathbf{C u}^{2+}$
 <br> \section*{More About <br> \section*{More About <br> <br> Calculating Cell Voltage <br> <br> Calculating Cell Voltage <br> <br> Can we make the $I$ - ion reduce water? <br> <br> Can we make the $I$ - ion reduce water? <br> <br> 4} <br> <br> 4} $2 \mathrm{I}^{-}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{I}_{2}+2 \mathrm{OH}^{-}+\mathrm{H}_{2} \quad \mathrm{E}^{\circ}=-1.363 \mathrm{~V}$ Non-spontaneous (negative $E^{\circ}$ ) reactions can be "forced" to occur with external voltage Voltage can be applied through battery, other voltaic cells, etc.
Applying 1.363 V to the above electrolytic cell will Are we cheating the second law of thermodynamics?

## cause the I- reduce water - electrolysis

Eo for a Voltaic Cell

All ingredients are present. Which way does the reaction proceed?

| More About |
| :---: |
| Calculating Cell Voltage |
| Can I- ion reduce water? From tables: |
| $2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-\rightarrow \mathrm{H}_{2}+2 \mathrm{OH}^{-} \quad \mathrm{E}^{\circ}=-.828 \mathrm{~V}$ |
| $2 \mathrm{I}^{-} \rightarrow \mathrm{I}_{2}+2 \mathrm{e}-\quad \mathrm{E}^{\circ}=-.535 \mathrm{~V}$ |
| $2 \mathrm{I}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{I}_{2}+2 \mathrm{OH}+\mathrm{H}_{2}$ |
| Assuming reaction occurs as written, |
| $\mathrm{E}_{\text {net }}^{\circ}=\mathrm{E}^{\circ}$ red $+\mathrm{E}^{\circ}{ }_{\text {ox }}=-0.828 \mathrm{~V}-0.535 \mathrm{~V}=-1.363 \mathrm{~V}$ |

Minus $\mathrm{E}^{\circ}$ means $\mathrm{r} \times \mathrm{n}$ occurs in opposite direction!

$$
\mathrm{I}_{2}+2 \mathrm{OH}^{-}+\mathrm{H}_{2} \rightarrow 2 \mathrm{I}^{-}+2 \mathrm{H}_{2} \mathrm{O} \quad \mathrm{E}^{\circ}=+1.363 \mathrm{~V}
$$

I- ion does not reduce water spontaneously!

## $\mathbf{E}^{\circ}$ and $\Delta \mathbf{G}^{\circ}$

$E^{\circ}$ is related to $\Delta G^{\circ}$, the free energy change for the reaction.

$$
\Delta \mathbf{G}^{\circ}=-\mathbf{n F} \mathbf{E}^{\circ}
$$

where $F=$ Faraday constant $=9.6485 \times 10^{4} \mathrm{C} / \mathrm{mol} \mathrm{e}^{-}$
and $n$ is the number of moles of electrons transferred

Memorize the value of F !
 1791-1867

## $\mathbf{E}^{\circ}$ and $\Delta \mathbf{G}^{\circ}$

$$
\Delta \mathbf{G}^{\circ}=-\mathbf{n} F E^{\circ}
$$

For a product-favored reaction
Reactants $\rightarrow$ Products
$\Delta \mathbf{G}^{\circ}<\mathbf{0}$ and so $\mathrm{E}^{\circ}>0$
$E^{\circ}$ is positive
For a reactant-favored reaction
Reactants $\leftarrow$ Products
$\Delta \mathbf{G}^{\circ}>\mathbf{0}$ and so $\mathbf{E}^{\circ}<0$ $E^{\circ}$ is negative

## Quantitative Aspects of Electrochemistry

The anode reaction in a lead storage battery is $\mathrm{Pb}(\mathrm{s})+\mathrm{HSO}_{4}(\mathrm{aq}) \rightarrow \mathrm{PbSO}_{4}(\mathrm{~s})+\mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{e}-$
If a battery delivers 1.50 amp , and you have 454 g of Pb , how long will the battery last?

## Solution

a) $454 \mathrm{~g} \mathrm{~Pb}=2.19 \mathrm{~mol} \mathrm{~Pb}$
b) Calculate moles of e -
$2.19 \mathrm{~mol} \mathrm{~Pb} \cdot \frac{2 \mathrm{~mol} \mathrm{e}-}{1 \mathrm{~mol} \mathrm{~Pb}}=4.38 \mathrm{~mol} \mathrm{e}-$
c) Calculate charge
$4.38 \mathrm{~mol} \mathrm{e}-96,485 \mathrm{C} / \mathrm{mol} \mathrm{e}-=423,000 \mathrm{C}$

## Quantitative Aspects of Electrochemistry

$$
\text { Amps }=\frac{\text { coulombs }}{\text { seconds }}
$$

A current of $1.50 \mathrm{amps}(1.50 \mathrm{C} / \mathrm{s})$ flows through a $\mathrm{Ag}^{+}(\mathrm{aq})$ solution for 15.0 min . What mass of Ag metal is deposited?

## Solution

(a) Charge $=1350 \mathrm{C}$
(b) Calculate moles of e- used ( $F=96,485 \mathrm{C} / \mathrm{mol} e^{-}$)
$1350 \mathrm{C} \cdot \frac{1 \mathrm{~mol} \mathrm{e}-}{96,485 \mathrm{C}}=0.0140 \mathrm{~mol} \mathrm{e}-$
(c) Calc. quantity of Ag
$0.0140 \mathrm{~mol} \mathrm{e}-\cdot \frac{1 \mathrm{~mol} \mathrm{Ag}}{1 \mathrm{~mol} \mathrm{e}-}=0.0140 \mathrm{~mol} \mathrm{Ag}$ or 1.51 g Ag

MAR

Quantitative Aspects of Electrochemistry

$\mathrm{Pb}(\mathrm{s})+\mathrm{HSO}_{4}-(\mathrm{aq}) \rightarrow \mathrm{PbSO}_{4}(\mathrm{~s})+\mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{e}-$
If a battery delivers 1.50 amp , and you have 454 g of Pb , how long will the battery last?
Solution
a) $454 \mathrm{~g} \mathrm{~Pb}=2.19 \mathrm{~mol} \mathrm{~Pb}$
b) Mol of e- $=4.38 \mathrm{~mol}$
c) Charge $=423,000 \mathrm{C}$
d) Calculate time $\quad$ Time $(s)=\frac{\text { Charge }(\mathrm{C})}{\mathrm{I}(\mathrm{amps})}$

Time $(s)=\frac{423,000 \mathrm{C}}{1.50 \mathrm{amp}}=282,000 \mathrm{~s} \quad$ About 78.3 hours

## The Nernst Equation

$Q$, the reaction quotient, can be related to non standard cell potentials, E
$E$ is related to $Q$, the reaction quotient, by:
$E=E^{\circ}-(R T / n F) \ln Q$
where $\quad R=$ Gas constant ( $8.3145 \mathrm{~J} / \mathrm{K} \mathrm{mol}$ )
T = Temperature (K)
F = Faraday constant
$E^{\circ}=$ standard cell potential
and
$\mathrm{n}=$ the number of moles of electrons transferred

## $E^{\circ}$ and $K$

At Equilibrium (K), combine $\Delta \mathbf{G}$ expressions for $E^{\circ}$ and $K$ to get:

$$
\mathrm{E}^{\circ}=\frac{\mathrm{RT}}{\mathrm{nF}} \ln \mathrm{~K}
$$

If at 298 K , can use:

$$
\mathrm{E}^{\circ}=\frac{0.0257}{\mathrm{n}} \ln \mathrm{~K}
$$

Only valid at 298 K!
Find equilibrium constants from $E^{*}$ data!

## The Nernst Equation

Example: Find E when $\left[\mathrm{Zn}^{2+}\right]=0.0010 \mathrm{M}, \mathrm{P}\left(\mathrm{H}_{2}\right)=$ 0.10 atm and $\mathrm{pH}=0$ at 290 . K.

Solution: Find $E^{\circ}$ for reaction under standard conditions first

$$
\begin{aligned}
& \mathrm{Zn}(\mathrm{~s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}-\quad \mathrm{E}^{\circ}=0.76 \mathrm{~V} \\
& 2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{e}-\longrightarrow \mathrm{H}_{2}(\mathrm{~g}) \quad \mathrm{E}^{\circ}=0.00 \mathrm{~V} \\
& 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g}) \\
& E^{\circ}{ }_{\text {net }}=0.76 \mathrm{~V}
\end{aligned}
$$

Note that $n=2$

This is the Nernst Equation (Handout)
MAR

## The Nernst Equation

$$
\begin{aligned}
& \qquad \mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s}) \\
& \text { For } \mathrm{Zn} / \mathrm{Cu} \text { cell, voltage is } 1.10 \mathrm{~V} \text { at } 25^{\circ} \mathrm{C} \text { when } \\
& {\left[\mathrm{Zn}^{2+}\right] \text { and }\left[\mathrm{Cu}^{2+}\right]=1.0 \mathrm{M}}
\end{aligned}
$$

Adding $\mathrm{Cu}^{2+}{ }_{(\mathrm{aq})}$ shifts reaction right (Le Chatelier's Principle), making reaction more spontaneous $(\Delta G)$ and $E^{\circ}$ more positive

The Nernst Equation
Example: Find E when $\left[\mathrm{Zn}^{2+}\right]=0.0010 \mathrm{M}, \mathrm{P}\left(\mathrm{H}_{2}\right)=0.10$ atm and $\mathrm{pH}=0$ at 290 . $\mathrm{K} .\left[\mathrm{H}^{+}\right]=1.0 \mathrm{M}$
$2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g}) \quad \mathrm{E}_{\text {net }}^{\circ}=0.76 \mathrm{~V}$
Solution
Use Nernst Equation:
$E=E^{\circ}-(R T / n F) \ln Q$
$E=0.76 \mathrm{~V}-(8.3145$ * 290. $\mathrm{K} / 2$ * 96485) In Q
$\left[\mathrm{H}^{+}\right]=10-\mathrm{pH} \mathrm{M}=10^{-0} \mathrm{M}=1.0 \mathrm{M}$
$\mathrm{Q}=\left[\mathrm{Zn}^{2+}\right] * \mathrm{P}_{\mathrm{H} 2} /\left[\mathrm{H}^{+}\right]^{2}=\left[0.0010 * 0.10 /(1.0)^{2}\right]$
$E=0.76 V+0.12 V=0.88 V$
MAR

## Electrochemical Processes in Batteries

A battery consists of self-contained voltaic cells arranged in series, so their individual voltages are added.

A primary battery cannot be recharged.
The battery is "dead" when the cell reaction has reached equilibrium.

A secondary battery is rechargeable. Once it has run down, electrical energy is supplied to reverse the cell reaction and form more reactant.

## Dry Cell Battery

A primary battery uses reactions that cannot be recharged

Anode (-)
$\mathbf{Z n} \rightarrow \mathbf{Z n}^{\mathbf{2 +}}+\mathbf{2 e}$ -

Cathode (+)
$2 \mathrm{NH}_{4}{ }^{+}+2 \mathrm{e}-\rightarrow$ $2 \mathrm{NH}_{3}+\mathrm{H}_{2}$

## Alkaline Battery

Nearly same reactions as in common dry cell, but under basic conditions.

Anode (-): $\mathrm{Zn}+2 \mathrm{OH}--->\mathrm{ZnO}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-$

Cathode (+): $2 \mathrm{MnO}_{2}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-\cdots \mathrm{Mn}_{2} \mathrm{O}_{3}+2 \mathrm{OH}^{-}$
$\mathrm{Zn}(\mathrm{s})+\mathrm{MnO}_{2}(\mathrm{~s})+\mathrm{H} 2 \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{ZnO}(\mathrm{s})+\mathrm{Mn}(\mathrm{OH})_{2}(\mathrm{~s})$
$E_{\text {cell }}=1.5 \mathrm{~V}$

## Silver Button Battery

Anode (oxidation): $\quad \mathrm{Zn}(s)+2 \mathrm{OH}-(a q) \rightarrow \mathrm{ZnO}(s)+\mathrm{H}_{2} \mathrm{O}(l)+2 \mathrm{e}^{-}$ Cathode (reduction): $\mathrm{Ag}_{2} \mathrm{O}(s)+\mathrm{H}_{2} \mathrm{O}(l)+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{Ag}(s)+2 \mathrm{OH}-(a q)$
Overall (cell) reaction: $\mathrm{Zn}(s)+\mathrm{Ag}_{2} \mathrm{O}(s) \rightarrow \mathrm{ZnO}(s)+2 \mathrm{Ag}(s)$

$$
E_{\text {cell }}=1.6 \mathrm{~V}
$$

## Lead-Acid Storage Battery

Anode $(0.36 \mathrm{~V}): \quad \mathrm{Pb}(s)+\mathrm{HSO}_{4}-(a q) \rightarrow \mathrm{PbSO}_{4}(s)+\mathrm{H}^{+}(a q)+2 \mathrm{e}^{-}$
Cathode (1.68 V):
$\mathrm{PbO}_{2}(s)+3 \mathrm{H}^{+}(a q)+\mathrm{HSO}_{4}-(a q)+2 \mathrm{e}^{-} \rightarrow \mathrm{PbSO}_{4}(s)+2 \mathrm{H}_{2} \mathrm{O}(l)$
Overall (cell) reaction (discharge):
$\mathrm{PbO}_{2}(s)+\mathrm{Pb}(s)+\mathrm{H}_{2} \mathrm{SO}_{4}(a q) \rightarrow 2 \mathrm{PbSO}_{4}(s)+2 \mathrm{H}_{2} \mathrm{O}(l) \quad E_{\text {cell }}=2.04 \mathrm{~V}$

Overall (cell) reaction (recharge):
$2 \mathrm{PbSO}_{4}(s)+2 \mathrm{H}_{2} \mathrm{O}(l) \rightarrow \mathrm{PbO}_{2}(s)+\mathrm{Pb}(s)+\mathrm{H}_{2} \mathrm{SO}_{4}(a q)$

## Nickel-Cadmium Battery

Anode (-):
$\mathrm{Cd}+2 \mathrm{OH} \rightarrow \mathrm{Cd}(\mathrm{OH})_{2}+2 \mathrm{e}-$

> Cathode (+):
$\mathrm{NiO}(\mathrm{OH})+\mathrm{H}_{2} \mathrm{O}+\mathrm{e}-\longrightarrow$ $\mathrm{Ni}(\mathrm{OH})_{2}+\mathrm{OH}^{-}$
Overall cell:
$2 \mathrm{NiO}(\mathrm{OH})+2 \mathrm{H}_{2} \mathrm{O}+\mathrm{Cd} \rightarrow$ $2 \mathrm{Ni}(\mathrm{OH})_{2}+\mathrm{Cd}(\mathrm{OH})_{2}$
$\mathrm{E}_{\text {cell }}=1.4 \mathrm{~V}$

MAR

Lithium Battery

## Hydrogen Fuel Cell

In a fuel cell reactants enter the cell and products leave, generating electricity through controlled combustion.
Reaction rates are lower in fuel cells than in other batteries, so an electrocatalyst is used to decrease the activation energy.

> Anode (oxidation):

Cathode (reduction):

$$
2 \mathrm{H}_{2}(g) \rightarrow 4 \mathrm{H}^{+}(a q)+4 \mathrm{e}^{-}
$$

Overall (cell) reaction:
$\mathrm{O}_{2}(g)+4 \mathrm{H}^{+}(a q)+4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(g)$ $2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \quad E_{\text {cell }}=1.2 \mathrm{~V}$

A tin-copper reaction as a voltaic and electrolytic cell

Lithium-Ion Battery

Anode (oxidation):
$\mathrm{Li}_{\mathrm{x}} \mathrm{C}_{6}(\mathrm{~s}) \rightarrow \mathrm{xLi}^{+}+\mathrm{xe}^{-}+\mathrm{C}_{6}(\mathrm{~s})$
Cathode (reduction):
$\mathrm{Li}_{1-\mathrm{x}} \mathrm{Mn}_{2} \mathrm{O}_{4}(\mathrm{~s})+\mathrm{xLi}^{+}+\mathrm{xe}^{-} \rightarrow \mathrm{LiMn}_{2} \mathrm{O}_{4}(\mathrm{~s})$
Overall (cell) reaction:
$\mathrm{Li}_{\mathrm{x}} \mathrm{C}_{6}(\mathrm{~s})+\mathrm{Li}_{1-\mathrm{x}} \mathrm{Mn}_{2} \mathrm{O}_{4}(\mathrm{~s}) \rightarrow \mathrm{LiMn}_{2} \mathrm{O}_{4}(\mathrm{~s})$
$\mathrm{E}_{\text {cell }}=3.7 \mathrm{~V}$

$\mathrm{Cu}(s) \rightarrow \mathrm{Cu}^{2+}(a q)+2 \mathrm{e}^{-}$
$\mathrm{Sn}^{2+}(a q)+2 \mathrm{e}^{-} \rightarrow \mathrm{Sn}(s)$ $\mathrm{Sn}^{2+}(a q)+\mathrm{Cu}(s) \rightarrow \mathrm{Sn}(s)+\mathrm{Cu}^{2+}(a q)$
electrolytic cell, $E$. electrolytic cell, $E_{\text {cell }}=-0.48 \mathrm{~V}$

Electrolysis of Aqueous NaOH

Electric Energy ----> Chemical Change

Anode (+) $\quad E^{\circ}=-0.40 \mathrm{~V}$
$4 \mathrm{OH}^{-} \rightarrow \mathrm{O}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}-$

Cathode (-) $\quad E^{\circ}=-0.83 \mathrm{~V}$
$4 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{e}-2 \mathrm{H}_{2}+4 \mathrm{OH}^{-}$
$\mathrm{E}^{\circ}$ for cell $=-1.23 \mathrm{~V}$

MAR

## Electrolysis

Using external electrical energy to produce chemical change in a nonspontaneous reaction
$\mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{Cl}-(\mathrm{aq}) \rightarrow \mathrm{Sn}(\mathrm{s})+\mathrm{Cl}_{2}(\mathrm{~g})$

MAR

## Electrolysis

Electric Energy ---> Chemical Change

Electrolysis of MoIten NaCl
Anode (+) $\quad E^{\circ}=-1.36 \mathrm{~V}$
$2 \mathrm{Cl} \rightarrow \mathrm{Cl}_{2}(\mathrm{~g})+2 \mathrm{e}-$

Cathode (-) $\quad E^{\circ}=-2.71 \mathrm{~V}$
$\mathrm{Na}^{+}+\mathrm{e} \rightarrow \mathrm{Na}$

Eo for cell = -4.07 V
External energy needed because $E^{\circ}$ is ( - ).

## Electrolysis of Aqueous NaCl

Producing Aluminum

$$
2 \mathrm{Al}_{2} \mathrm{O}_{3}+3 \mathrm{C} \rightarrow 4 \mathrm{Al}+3 \mathrm{CO}_{2}
$$

Charles Hall (1863-1914) developed electrolysis process, founded Alcoa (alcoa.com)

Electrolysis of Aqueous NaCl
Cells like these are the source of NaOH and $\mathrm{Cl}_{2}$. In 2006
65 million tons $\mathrm{Cl}_{2}$ 81 million tons NaOH

Also the source of NaOCl for use in bleach.

Page III-17-16 / Chapter Seventeen Lecture Notes

Important Equations, Constants, and Handouts from this Chapter:

- know how to balance
redox reactions in acid or base conditions
- be able to calculate $E^{\circ}$ and $E$ for cells

Handouts:

- Thermodynamic Values and Electrochemical
Cell Values (Problem Set \#5)

## End of Chapter Problems: Test Yourself

You will need the table of reduction potentials found in problem set \#5

1. Write a balanced equation for the following half-reaction: $\mathrm{VO}_{3^{-1}}(\mathbf{a q}) \rightarrow \mathrm{V}^{\mathbf{2 +}}$ (aq) (in acid)
Write a balanced equation for the following half-reaction: $\mathbf{A g}(\mathbf{s}) \rightarrow$ $\mathrm{Ag}_{2} \mathrm{O}(\mathrm{s})$ (in base)
Balance the following redox equation in acid: $\mathbf{Z n}(\mathbf{s})+\mathrm{NO}_{3^{-1}}(\mathbf{a q}) \rightarrow \mathbf{Z n}^{2+}$ $(\mathrm{aq})+\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$
2. Balance the following redox equation in base: $\mathrm{CrO}_{4}{ }^{2-}-(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq}) \rightarrow$ $\mathrm{Cr}(\mathrm{OH})_{3}(\mathrm{~s})+\mathrm{SO}_{4}{ }^{2} \cdot(\mathrm{aq})$
3. Balance the following unbalanced equation in acid, then calculate the standard redox potential, $E^{\circ}: \mathrm{Cu}(\mathrm{s})+\mathrm{NO}_{3^{-1}}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{NO}(\mathrm{g})$
4. Calculate $E^{\circ}, \Delta G^{\circ}$ and the equilibrium constant for the following reaction: $2 \mathrm{Fe}^{3+}(\mathrm{aq})+2 \mathrm{I}^{-1}(\mathrm{aq}) \rightarrow 2 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq})$

End of Chapter Problems: Answers

1. $\mathrm{VO}_{3}^{-}(\mathrm{aq})+6 \mathrm{H}^{+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{V}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
2. $2 \mathrm{Ag}(\mathrm{s})+2 \mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{Ag}_{2} \mathrm{O}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+2 \mathrm{e}^{-}$
3. $4 \mathrm{Zn}(\mathrm{s})+2 \mathrm{NO}_{3}^{-}-(\mathrm{aq})+10 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+4 \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$
4. $2 \mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq})+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+3 \mathrm{SO}_{3^{2}-(\mathrm{aq}) \rightarrow 2 \mathrm{Cr}(\mathrm{OH})_{3}(\mathrm{~s})+4 \mathrm{OH}^{-}(\mathrm{aq})+3}$
5. $\mathrm{SO}_{4^{2-}}{ }^{2-}(\mathrm{aq})$ (aq) $+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+3 \mathrm{SO}_{3^{2-}}(\mathrm{aq}) \rightarrow 2 \mathrm{Cr}(\mathrm{OH})_{3}(\mathrm{~s})+4 \mathrm{OH}^{-}(\mathrm{aq})+3$
6. $3 \mathrm{Cu}(\mathrm{s})+2 \mathrm{NO}_{3}^{-1}(\mathrm{aq})+8 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 2 \mathrm{NO}(\mathrm{g})+3 \mathrm{Cu}^{2+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}), E^{\circ}=$
7. $E^{\circ}=0.236 \mathrm{~V}, \Delta G^{\circ}=-45.5 \mathrm{~kJ}, \mathrm{~K}=9 \times 10^{7}$

You will need the table of reduction potentials found in problem set \#5

## Chemistry 223 Exam II Review

Chapters 15, 16 and 17

Chemistry 223
Professor Michael Russell
MAR

If the solubility of $\mathrm{BaF}_{2}$ is $3.6 \times 10^{-3}$, a reasonable value for $\mathrm{K}_{\mathrm{sp}}$ for $\mathrm{BaF}_{2}$ is
A. $3.6 \times 10^{-3}$
B. $7.2 \times 10^{-3}$
C. $1.1 \times 10^{-2}$
D. $1.9 \times 10^{-7}$
E. $4.7 \times 10^{-8}$

Decide if a precipitate will form when mixing the indicated reagents (all concentrations are 1.0 $\mathrm{M})$.

$$
\mathrm{KCl}(\mathrm{aq})+\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq}) \rightarrow ?
$$

A. Yes
B. No
C. Who knows!

Which lead salt has the greatest molar solubility in water at $25^{\circ} \mathrm{C}$ ?
A. $\mathrm{PbCO}_{3}$
$\mathrm{K}_{\text {sp }}=1.5 \times 10^{-13}$
B. PbS
C. $\mathrm{PbSO}_{4}$
$\mathrm{K}_{\text {sp }}=8.4 \times 10^{-28}$
$\mathrm{K}_{\text {sp }}=1.8 \times 10^{-4}$

A solution contains $0.10 \mathrm{M} \mathrm{K}_{2} \mathrm{SO}_{3}$ and $0.30 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$. Solid $\mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}$ is added slowly. Which precipitates first, $\mathrm{CaSO}_{3}$ or $\mathrm{CaSO}_{4}$ ?
A. $\mathrm{CaSO}_{3}$
B. $\mathrm{CaSO}_{4}$
C. 42
$\mathrm{K}_{\text {sp }}$ for $\mathrm{CaSO}_{3}=1.3 \times 10^{-8}$

$$
\mathrm{K}_{\mathrm{sp}} \text { for } \mathrm{CaSO}_{4}=2.4 \times 10^{-5}
$$

$\mathrm{CaSO}_{3}$ precipitates first as $\mathrm{Ca}^{2+}$ ions are added to a solution containing $0.10 \mathrm{M} \mathrm{K}_{2} \mathrm{SO}_{3}$ and $0.30 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$. What is $\left[\mathrm{SO}_{3}{ }^{2-}\right]$ as the $\mathrm{CaSO}_{4}$ begins to precipitate?

$$
\mathrm{K}_{\mathrm{sp}}\left(\mathrm{CaSO}_{3}\right)=1.3 \times 10^{-8} \quad \mathrm{~K}_{\mathrm{sp}}\left(\mathrm{CaSO}_{4}\right)=2.4 \times 10^{-5}
$$

A. 0.10 M
B. 0.30 M
C. $1.6 \times 10^{-4} \mathrm{M}$
D. $5.4 \times 10^{-4} \mathrm{M}$
E. 42

## What is the pH of a saturated solution of

 $\mathrm{Mg}(\mathrm{OH})_{2} ?\left(\mathrm{~K}_{\mathrm{sp}}\left(\mathrm{Mg}(\mathrm{OH})_{2}\right)=5.6 \times 10^{-12}\right)$A. 3.65
B. 8.37
C. 10.35
D. 0.15
E. 11.25

## MAR

Which of the following shows the correct formation constant $\left(K_{f}\right)$ equation for $\mathrm{Cr}(\mathrm{CN})_{6}{ }^{3-}$ ?
A. $\mathrm{Cr}(\mathrm{CN})_{3}(\mathrm{~s})+3 \mathrm{CN}^{-1}(\mathrm{aq}) \rightleftarrows \mathrm{Cr}(\mathrm{CN})_{6}{ }^{3-}(\mathrm{aq})$
B. $\mathrm{Cr}\left(\mathrm{NO}_{3}\right)_{3}(\mathrm{~s})+6 \mathrm{NaCN}(\mathrm{aq}) \rightleftarrows \mathrm{Cr}(\mathrm{CN})_{6}{ }^{3-}(\mathrm{aq})+$ $3 \mathrm{NaNO}_{3}(\mathrm{aq})+3 \mathrm{Na}^{+}(\mathrm{aq})$
C. $\mathrm{Cr}(\mathrm{CN})_{8^{3-}}(\mathrm{s}) \rightleftarrows \mathrm{Cr}^{3+}(\mathrm{aq})+6 \mathrm{CN}^{-1}(\mathrm{aq})$
D. $\mathrm{Cr}(\mathrm{CN}) 6^{3-}(\mathrm{aq}) \rightleftarrows \mathrm{Cr}^{3+}(\mathrm{aq})+6 \mathrm{CN}^{-1}(\mathrm{aq})$
E. $\mathrm{Cr}^{3+}(\mathrm{aq})+6 \mathrm{CN}^{-1}(\mathrm{aq}) \rightleftarrows \mathrm{Cr}(\mathrm{CN}) 6^{3-}(\mathrm{aq})$

## MAR

MAR

Calculate $\Delta \mathrm{G}_{\mathrm{rx}}{ }^{\circ}$ for the following reaction:
$\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
${ }^{*} \Delta \mathrm{G}_{\mathrm{f}}{ }^{\circ}\left[\mathrm{CO}_{2}(\mathrm{~g})\right]=-394.4 \mathrm{~kJ} / \mathrm{mol}$

* $\Delta \mathrm{G}_{\mathrm{f}}{ }^{\circ}\left[\mathrm{CH}_{4}(\mathrm{~g})\right]=-50.8 \mathrm{~kJ} / \mathrm{mol}$
${ }^{*} \Delta \mathrm{G}_{\mathrm{f}}{ }^{\circ}\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{g})\right]=-228.6 \mathrm{~kJ} / \mathrm{mol}$
A. $572.2 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
B. $-673.7 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
C. $-572.2 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
D. $-436.4 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
E. $-800.8 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$

A solution has $\left[\mathrm{Pb}^{2+}\right]=0.0012 \mathrm{M}$ and $\left[\mathrm{Cl}^{-}\right]$
$=0.010 \mathrm{M}$. Will $\mathrm{PbCl}_{2}$ precipitate?
$\mathrm{K}_{\text {sp }}\left(\mathrm{PbCl}_{2}\right)=1.7 \times 10-5$
A. Yes, $\mathrm{PbCl}_{2}$ precipitates
B. No, $\mathrm{PbCl}_{2}$ does NOT precipitate

Calculate the standard entropy change for the
following reaction:

$$
\mathrm{CCl}_{4}(\mathrm{I})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{Cl}_{2}(\mathrm{~g})
$$

* $\mathrm{S}^{\circ}\left[\mathrm{CCl}_{4}(\mathrm{I})\right]=214.39 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$
A. $-17.36 \mathrm{~J} / \mathrm{K}$
${ }^{*} \mathrm{~S}^{\circ}\left[\mathrm{CO}_{2}(\mathrm{~g})\right]=213.74 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$
B. $+17.36 \mathrm{~J} / \mathrm{K}$
* $\mathrm{S}^{\circ}\left[\mathrm{O}_{2}(\mathrm{~g})\right]=205.07 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$
C. $+240.44 \mathrm{~J} / \mathrm{K}$
* $\mathrm{S}^{\circ}\left[\mathrm{Cl}_{2}(\mathrm{~g})\right]=223.08 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$
D. $-25.78 \mathrm{~J} / \mathrm{K}$
E. 42

Given the following information, calculate $\Delta G^{\circ}$ for the reaction below at $25^{\circ} \mathrm{C}$ :

| $\mathbf{M g}(\mathbf{s})+\mathbf{1} / \mathbf{2} \mathbf{O}_{\mathbf{2}}(\mathbf{g}) \rightarrow \mathbf{M g O}(\mathbf{s})$ | A. $664.5 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |
| :--- | :--- |
| $\Delta \mathrm{H}^{\circ}=-601.24 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ | B. $-568.9 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |
| $\Delta \mathrm{S}^{\circ}=-108.36 \mathrm{~J} / \mathrm{K} \cdot \mathrm{rxn}$ | C. $31700 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |
|  | D. $-528.3 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |
|  | E. 42 |

A reaction has a $\Delta \mathrm{H}^{\circ}$ which is positive and a $\Delta \mathrm{S}^{\circ}$ which is positive. What can be said about the reaction spontaneity at different temperatures?
A. product favored at all temperatures
B. product favored only at high temperature
C. product favored only at low temperature
D. not product favored at any temperature

Calculate $\Delta \mathrm{G}^{\circ}$ at $25^{\circ} \mathrm{C}$ for: $\mathbf{2} \mathbf{H}_{\mathbf{2}} \mathrm{O}_{\mathbf{2}}(\mathrm{I}) \rightarrow \mathbf{2} \mathbf{H}_{\mathbf{2}} \mathbf{O}(\mathrm{I})+\mathbf{O}_{\mathbf{2}}(\mathrm{g})$

|  | $\Delta \mathbf{H}^{\circ}(\mathbf{k J} / \mathrm{mol})$ | $\mathbf{S}^{\circ}(\mathbf{J} / \mathbf{K} \cdot \mathrm{mol})$ |
| :--- | :--- | :--- |
| $\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{l})$ | -187.8 | 109.6 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ | -285.8 | 69.9 |
| $\mathrm{O}_{2}(\mathrm{~g})$ | ---- | 205.1 |
| $\mathrm{A}-.157.9 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |  |  |
| $\mathrm{B} .-192.3 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |  |  |
| $\mathrm{C} .-37700 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |  |  |
| D. $-233.5 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$ |  |  |
| E. 42 |  |  |

MAR

A reaction has $\Delta \mathrm{H}=-96.0 \mathrm{~kJ} / \mathrm{mol}$ and $\Delta \mathrm{S}=-12.6 \mathrm{~J} /$
$\mathrm{K} \cdot \mathrm{mol}$. If the temperature is increased slowly, at what temperature will this reaction become nonspontaneous?
A. It will never be
spontaneous
B. $7162{ }^{\circ} \mathrm{C}$
C. 762 K
D. 7620 K
E. -57.6 K

MAR

Balance the following reaction ( $\mathrm{pH}=8.37$ ):
$\mathrm{MnO}_{4}{ }^{-}+\mathrm{I}^{-} \rightarrow \mathrm{MnO}_{2}+\mathrm{I}_{2}$
A. $\mathrm{MnO}_{4}^{-}+2 \mathrm{I}^{-} \rightarrow \mathrm{MnO}_{2}+\mathrm{I}_{2}+\mathrm{O}_{2^{2-}}$
B. $8 \mathrm{H}^{+}+2 \mathrm{MnO}_{4}^{-}+6 \mathrm{I}^{-} \rightarrow 2 \mathrm{MnO}_{2}+3 \mathrm{I}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
C. $8 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{MnO}_{4}^{-}+12 \mathrm{I}^{-} \rightarrow 4 \mathrm{MnO}_{2}+6 \mathrm{I}_{2}+16 \mathrm{OH}^{-}$
D. $4 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{MnO}_{4}^{-}+6 \mathrm{I}^{-} \rightarrow 2 \mathrm{MnO}_{2}+3 \mathrm{I}_{2}+8 \mathrm{OH}^{-}$

What is the strongest reducing agent in the list?

| Half-Reaction | $E^{\circ}(V)$ |
| :--- | :--- |
| $\mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{e}-\rightarrow \mathrm{Ce}^{3+}(\mathrm{aq})$ | +1.61 |
| $\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{e}-\rightarrow \mathrm{Ag}(\mathrm{s})$ | +0.80 |
| $\mathrm{Hg}_{2}{ }^{2+}(\mathrm{aq})+2 \mathrm{e}-\rightarrow 2 \mathrm{Hg}(\ell)$ | +0.79 |
| $\mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{e}-\rightarrow \mathrm{Sn}(\mathrm{s})$ | -0.14 |
| $\mathrm{Ni}^{2+}(\mathrm{aq})+2 \mathrm{e}-\rightarrow \mathrm{Ni}(\mathrm{s})$ | -0.25 |
| $\mathrm{Al}^{3+}(\mathrm{aq})+3 \mathrm{e}-\rightarrow \mathrm{Al}(\mathrm{s})$ | -1.66 |

A. $\mathrm{Ce}^{4+}$
B. $\mathrm{Al}^{3+}$
C. Sn
D. AI
E. Jq
$\mathrm{Al}^{3+}$

Barium sulfite is poorly soluble in water with a $\mathrm{K}_{\text {sp }}$ value of $8.0 \times 10^{-7}$. What is $\Delta \mathrm{G}^{\circ}$ at $25^{\circ} \mathrm{C}$ ?
A. $15.1 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
B. $34.8 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
C. $-34.8 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
D. $343 \mathrm{~kJ} / \mathrm{mol} \cdot \mathrm{rxn}$
E. 42

A. Yes
B. No
C. Only if it feels
like it
+0.80 -0.14

A voltaic cell is created using the information below to be used in Alaska where the average temperature is $5.00^{\circ} \mathrm{C}$. Calculate the expected cell potential under these conditions.
$\mathrm{Al}(\mathrm{s})\left|\mathrm{Al}^{3+}(\mathrm{aq}, 0.0010 \mathrm{M})\right|\left|\mathrm{Ni}^{2+}(\mathrm{aq}, 0.50 \mathrm{M})\right| \mathrm{Ni}(\mathrm{s})$
$\mathrm{Ni}^{2+}(\mathrm{aq})+2 \mathrm{e} \rightarrow \mathrm{Ni}(\mathrm{s}) \quad-0.25 \mathrm{~V}$
$\mathrm{Al}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{Al}(\mathrm{s})$
$-1.66 \mathrm{~V}$
A. 1.46 V
B. 1.31 V
C. 1.17 V
D. 0.51 V
E. -1.91 V

## Color Theory

Where does the color of objects come from？
From the paint covering the object！

Where does the paint gets its color？

From the paint pigments！

What are the pigments？
Colorful transition metal compounds！

## Why Study Transition Metals

－Transition metals found in nature
$\wedge$ Rocks and minerals contain transition metals
＊Red rubies（Cr），blue sapphires（Fe and Ti）
＾Many biomolecules contain transition metals
＊Vitamin B12（Co），Hemoglobin，myoglobin，and cytochrome C（all Fe）
－Transition metals used in industry
－Material science（steel，alloys）
${ }^{\wedge}$ Transition metal compounds are used as pigments
＊ $\mathrm{TiO}_{2}$（white）， $\mathrm{PbCrO}_{4}$（yellow）， $\mathrm{Fe}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{3}$（Prussian blue）

## Periodic Table

MAR

## Transition Metals

－General Properties
人 Have typical metallic properties（malleable，etc．）
人 Not as reactive as alkali and alkaline earth metals
${ }^{\wedge}$ Have high melting points，high boiling points，high density
$\lambda$ Have 1 or $2 s$ electrons in valence shell
人 Differ in \＃d electrons in n－1 energy level
$\boldsymbol{\lambda}$ Exhibit multiple oxidation states
－Both paramagnetic and diamagnetic ions exist
人 Most ions deeply colored（crystal field theory）

## Electronic Configurations

| Element | Configuration |
| :---: | :--- |
| Sc | $[\mathrm{Ar}] 3 \mathrm{~d}^{1} 4 \mathrm{~s}^{2}$ |
| Ti | $[\mathrm{Ar}] 3 \mathrm{~d}^{2} 4 \mathrm{~s}^{2}$ |
| V | $[\mathrm{Ar}] 3 \mathrm{~d}^{3} 4 \mathrm{~s}^{2}$ |
| Cr | $[\mathrm{Ar}] 3 \mathrm{~d}^{5} 4 \mathrm{~s}^{1}$ |
| Mn | $[\mathrm{Ar}] 3 \mathrm{~d}^{5} 4 \mathrm{~s}^{2}$ |
| Fe | $[\mathrm{Ar}] 3 \mathrm{~d}^{6} 4 \mathrm{~s}^{2}$ |
| Ni | $[\mathrm{Ar}] 3 \mathrm{~d}^{8} 4 \mathrm{~s}^{2}$ |
| Cu | $[\mathrm{Ar}] 3 \mathrm{~d}^{104 \mathrm{~s}^{1}}$ |
| Zn | $[\mathrm{Ar}] 3 \mathrm{~d}^{104 \mathrm{~s}^{2}}$ |

## Electronic Configurations of Transition Metal Ions

Electronic configuration of Fe ions:

$$
\underset{[\mathrm{Ar}] 3 \mathrm{~d}^{6} 4 \mathrm{~s}^{2}}{\mathrm{Fe}}-2 \mathrm{e}^{-} \rightarrow \underset{[\mathrm{Ar}] \mathrm{d}^{6}}{\mathrm{Fe}^{2+}}-\mathrm{e}^{-} \longrightarrow \underset{[\mathrm{Ar}] \mathrm{d}^{5}}{\mathrm{Fe}^{3+}}
$$

valence $n s$ electrons removed first,
then $n-1 d$ electrons

Oxidation States of Transition Elements

| Sc | Ti | V | Cr | Mn | Fe | Co | Ni | Cu | Zn |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  | +1 | +1 |  |
|  | +2 | +2 | +2 | +2 | +2 | +2 | +2 | +2 | +2 |
| +3 | +3 | +3 | +3 | +3 | +3 | +3 | +3 | +3 |  |

|  |  |  |  | +7 |  |  |  |  |  |

loss of ns e-s

## Paramagnetism and Diamagnetism

Paramagnetic species have unpaired electrons while diamagnetic species have all paired electrons
Paramagnetic species are attracted or repulsed by magnetic fields; the magnitude of the effect depends on the number of unpaired electrons
Examples:
Paramagnetic Cr

$\uparrow$
4 s

Diamagnetic Pd

## Coordination Chemistry

Transition metals act as Lewis acids and form complexes or complex ions with Lewis bases or ligands

$$
\begin{aligned}
& \mathrm{Fe}^{3+}(\mathrm{aq})+6 \mathrm{CN}-(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{CN})_{6}{ }^{3-}(\mathrm{aq}) \\
& \mathrm{Ni}^{2+}(\mathrm{aq})+6 \mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{Ni}\left(\mathrm{NH}_{3}\right)_{6}{ }^{2+}(\mathrm{aq}) \\
& \text { Lewis acid Lewis base Complex ion }
\end{aligned}
$$

Complex contains central metal ion bonded to one or more molecules or anions

Lewis acid = metal $=$ center of coordination
Lewis base $=$ ligand $=$ molecules/ions covalently bonded to metal in complex

MAR

## Coordination Chemistry

A coordination compound has one or more complexes.
Examples: $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right] \mathrm{Cl}_{3},\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]\left[\mathrm{PtCl}_{4}\right]$, $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$
The coordination number is the number of donor atoms bonded to the central metal atom or ion in the complex. Example: $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$ coordination number $=\mathbf{6}$ Example: $\left[\mathrm{PtCl}_{4}\right]^{2-}$ coordination number $=\mathbf{4}$
Most common $=6,4$ and 2
Coordination number determined by ligands

## Common Geometries of Complexes

Linear
Example: $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$

Common Geometries of Complexes
Coordination Number Geometry

Examples: $\left[\mathrm{Co}(\mathrm{CN})_{6}\right]^{3-},\left[\mathrm{Fe}(\mathrm{en})_{3}\right]^{3+}$

octahedral

## Coordination Chemistry

Ligands - aka Lewis bases
$\lambda_{\text {classified according to the number of bonds to }}$ central metal
人 "dentate" = "tooth"
人 Examples
*monodentate = 1 * bidentate $=2$ *tetradentate $=4$ *hexadentate $=6$ *polydentate $=2$ or more donor atoms

## Common Geometries of Complexes Coordination Number <br> $\qquad$ Geometry

4 square planar
(characteristic of metal ions with 8 de e ) Example: $\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]^{2-}$

## Coordination Chemistry

Charge of complex $=$ sum of charges on the metal and the ligands
Charge of coordination compound $=$ sum of charges on metal, ligands, and counterbalancing ions

anionic complex

neutral compound

MAR

## Monodentate Ligands

Monodentate ligands possess only one accessible donor group.
$\mathrm{H}_{2} \mathrm{O}$ is a good example since all metal ions exist as aqua complexes in water
Monodentate Ligand Examples:
${ }^{1} \mathrm{H}_{2} \mathrm{O}, \mathrm{CN}^{-}, \mathrm{NH}_{3}, \mathrm{NO}_{2}{ }^{-}, \mathrm{SCN}-\mathrm{OH}, \mathrm{X}^{-}$(halides), $\mathrm{CO}, \mathrm{O}^{2-}$
Example Complexes:
${ }^{\boldsymbol{L}}\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]^{3+}$
${ }^{1}\left[\mathrm{Fe}(\mathrm{SCN})_{6}\right]^{3-}$

## Bidentate Ligands

Bidentate Ligands have＂two teeth＂，able to bond with metal at two separate places
Bidentate Examples：
人 oxalate ion $=\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$
人 ethylenediamine（en）$=\mathrm{NH}_{2} \mathrm{CH}_{2} \mathbf{C H}_{2} \mathbf{N H}_{2}$
人 ortho－phenanthroline（o－phen）
Example Complexes：
$\wedge\left[\mathrm{Co}(\mathrm{en})_{3}\right]^{3+}$
人 $\left[\mathrm{Cr}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{3}\right]^{3-}$
人 $\left[\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{4}(\text { o－phen })\right]^{3+}$

## Bidentate Ligands

MAR

Bidentate Ligands
$\mathrm{Fe}(0-\mathrm{phen})_{3^{2+}}{ }^{\text {：}}$

MAR

## EDTA

A commonly used polydentate ligand
Forms 1：1 complexes with most metals except Group IA

Forms stable，water soluble complexes
High formation constants
A primary standard material
See the movie＂Blade＂（！）

MAR

## EDTA

Six Donor Regions

EDTA (Ethylenediamine tetraacetic acid) will adapt its coordination number to bond with the metal

MAR

Porphine, an important
chelating agent found in $\quad$ Other Chelating Agents

Oxymyoglobin

## Nomenclature of Coordination

The cation is named before the anion．When naming a complex：
－Cations named first，then anions．Anion metal gets －ate ending
－Ligands are named first in alphabetical order．Most ligands have－o ending；multiple ligands use Greek prefixes
－Metal atom／ion is named last with the oxidation state in Roman numerals．
－Use no spaces in complex name
－See Coordination Compounds Handout

Most metals in this section octahedral，

## Nomenclature：IUPAC Rules

Neutral ligands are referred to by their usual name with these exceptions：
人 water， $\mathrm{H}_{2} \mathrm{O}=$ aqua
人 ammonia， $\mathrm{NH}_{3}=$ ammine
$\boldsymbol{\lambda}_{\text {carbon monoxide，}} \mathrm{CO}=$ carbonyl
人 hydroxide， $\mathrm{OH}^{-}=$hydroxo
If the ligand name already contains a Greek prefix，use alternate prefixes for multiple occurrences：
－bis－，2；tris－，3；tetrakis－， 4 ；pentakis－，5；hexakis－， 6
人 The name of the ligand is placed in parentheses；i．e． bis（ethylenediamine）
MAR

Nomenclature
Tris（ethylenediamine）nickel（II）ion

Vaska＇s compound
Carbonylchlorobis（triphenylphosphine）iridium（I）
MAR

## Nomenclature：IUPAC Rules

$\left[\mathrm{CoCl}\left(\mathrm{NH}_{3}\right)_{5}\right] \mathrm{Cl}_{2}$
pentaamminechlorocobalt（III）chloride
$\mathrm{K}_{2}\left[\mathrm{Cd}(\mathrm{CN})_{4}\right]$
Potassium tetracyanocadmate（II）
$\mathrm{NiCl}_{2}(\mathrm{en})_{2}$
Dichlorobis（ethylenediamine）nickel（II）
$\mathrm{CrCl}_{3}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}\right)_{3}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}=\right.$ tetrahydrofuran $)$
Trichlorotris（tetrahydrofuran）chromium（III）

square planar $\mathrm{Pt}(\mathrm{II})$

coordination number 4 cis－isomer
the first of a series of platinum coordination complex－
based anti－cancer drugs（Platinol－AQ）

## Isomerism

Isomers are compounds that have the same
composition but a different arrangement of atoms in space
Important in inorganic and organic chemistry
Major Types include：
$\boldsymbol{\lambda}$ coordination sphere isomers
人 linkage isomers
人 geometric isomers（cis，trans，mer，fac）
人 stereoisomers

Linkage isomers differ in which atom of a ligand is bonded to the metal in the complex
Consider $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5}(\mathrm{ONO})\right]^{2+}$
and $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5}\left(\mathrm{NO}_{2}\right)\right]^{2+}$

## Linkage Isomers

．

## Geometric Isomers

Geometric isomers have same types and number of atoms，but they differ in the spatial arrangements of the ligands
Inorganic complexes exhibit cis and trans isomerism in square planar and octahedral complexes，as well as mer and $f a c$ isomers in octahedral complexes
Geometric isomers lead to different colors， melting points，boiling points，reactivities， solubilities，etc．

MAR

## Coordination Sphere Isomers

Coordination sphere isomers differ if a ligand is bonded to the metal in the complex，as opposed to being outside the coordination sphere（ionic bonding）．Different reactivities！
Consider $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Br}$ vs．$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right] \mathrm{Cl}$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Br} \rightarrow\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right]^{+}+\mathrm{Br}$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right] \mathrm{Cl} \rightarrow\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right]^{+}+\mathrm{Cl}-$
With $\mathrm{AgNO}_{3}$ ：
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Br}(\mathrm{aq})+\mathrm{AgNO}_{3}(\mathrm{aq}) \rightarrow$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{NO}_{3}(\mathrm{aq})+\mathrm{AgBr}(\mathrm{s})$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right] \mathrm{Cl}(\mathrm{aq})+\mathrm{AgNO}_{3}(\mathrm{aq}) \rightarrow$
$\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Br}\right] \mathrm{NO}_{3}(\mathrm{aq})+\mathrm{AgCl}(\mathrm{s})$

## Geometric Isomers

mer isomer

fac isomer

$$
\left[\mathrm{CrCl}_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right] \text { - octahedral }
$$

Optical Isomers

## Optical Isomers

Optical isomers are isomers that are nonsuperimposable mirror images
Optical isomers are called chiral (handed) and referred to as enantiomers
A substance is chiral if it does not have a plane of symmetry

## Properties of Optical Isomers

Optical isomers or enantiomers possess many identical properties
Enantiomers have similar solubilities, melting points, boiling points, colors, chemical reactivity (with nonchiral reagents)
Enantiomers differ in their interactions with plane polarized light and other chiral reagents

MAR

## Optical Isomers

## Properties of Optical Isomers

Differences in enantiomer reactivity with other chiral reagents can lead to separation methods
Example:

$$
\begin{aligned}
& d-\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}(\mathrm{aq})+d, l-\left[\mathrm{Co}(\mathrm{en})_{3}\right] \mathrm{Cl}_{3}(\mathrm{aq}) \rightarrow \\
& \text { chiral reagent } \quad \text { racemic mixture } \\
& d-\left[\mathrm{Co}(\mathrm{en})_{3}\right]\left(d-\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}\right) \mathrm{Cl}(\mathrm{~s})+ \\
& \text { solid } d \text { enantiomer } \\
& \quad l-\left[\mathrm{Co}(\mathrm{en})_{3}\right] \mathrm{Cl}_{3}(\mathrm{aq})+2 \mathrm{Cl}-(\mathrm{aq}) \\
& \text { aqueous } l \text { enantiomer }
\end{aligned}
$$

Very complex procedures, but important (Ritalin, Thalidomide, etc.)

## Crystal Field Theory

Crystal Field Theory is a model for bonding in transition metal complexes
Accounts for color and magnetism of complexes quite well
Focuses on d-orbitals of metals. Ligands are considered to be point negative charges
Assumes ionic bonding (no covalent bonding)
As in organic chemistry, molecular orbital theory is better but much more complex

## Crystal Field Theory

Electrostatic attractions between the positive metal ion and the negative ligands bond them together, lowering the energy of the whole system
The lone pair e-'s on ligands repulsed by e-'s in metal d orbitals; this interaction is called the crystal field
The repulsion influences d orbital energies, but not all d orbitals influenced the same way

MAR
ligands approach along $x, y, z$ axes

d Orbitals and the Ligand Field

## Crystal Field Theory

greater electrostatic repulsion $=$ higher potential energy

## Crystal Field Theory

E

Crystal Field Theory

less electrostatic repulsion = lower potential energy

Crystal Field Splitting Energy

## Octahedral Crystal Field

metal ion in octahedral complex

## Crystal Field Theory

Crystal Field Theory can be used to account for the colors of complexes as well as magnetic properties
A complex must have a partially filled metallic d subshell to exhibit color; i.e. a complex with $\mathrm{d}^{0}$ or $\mathrm{d}^{10}$ is colorless

Amount of paramagnetism depends on ligands; i.e. $\left[\mathrm{FeF}_{6}\right]^{3-}$ has five unpaired electrons while $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$ has only one

Visible Spectrum

Compounds/complexes with color absorb specific wavelengths of visible light ( $\mathbf{4 0 0} \mathbf{- 7 0 0} \mathbf{n m}$ ); wavelengths not absorbed are transmitted

## More on Colors

The color observed in a compound/complex is actually the complementary color of the color absorbed

## Colors of Transition Metal Complexes

Absorption of UV-visible radiation by compound or complex occurs only if the radiation has the energy needed to raise an e - from its ground state (highest occupied orbital or HOMO) to an excited state (usually the lowest unoccupied orbital or LUMO)
The light energy absorbed = energy difference between the ground state and excited state, or

$$
\Delta \mathbf{E}=\mathbf{E}_{\text {LUMO }}-\mathbf{E}_{\text {HOMO }}=\mathbf{h} v=\mathbf{h c} / \lambda_{\max }
$$

## Visible Spectrum

wavelength, nm
(Each wavelength corresponds to a different color)

$$
\longleftarrow \quad \text { higher energy }
$$

lower energy

White $=$ all the colors (wavelengths)

MAR

## More on Colors

The color observed in a compound/complex is actually the

## Colors of Transition Metal Complexes

Absorption raises an electron from the lower d subshell to the higher d subshell.

## Colors of Transition Metal Complexes

The magnitude of $\Delta$ depends on the ligand field (i.e. types of ligands) and the metal, and $\Delta$ determines the color of the complex
Different complexes exhibit different colors due to the magnitude of $\triangle$
larger $\Delta=$ higher energy light absorbed, shorter wavelengths
smaller $\Delta$ = lower energy light absorbed, longer wavelengths

## Colors of Transition Metal Complexes

MAR

## Colors of Transition Metal Complexes

The Spectrochemical Series:
Smallest $\Delta$ increases

## Spectrochemical

 Series

## Paramagnetism of Transition Metal Complexes

Many complexes / compounds are paramagnetic due to unpaired d electrons
The degree of paramagnetism dependent on ligands ("ligand field")
Example with $\mathrm{Fe}^{3+}$ :
$\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$ has 1 unpaired d electron
$\left[\mathrm{FeF}_{6}\right]^{3-}$ has 5 unpaired d electrons
Crystal Field Theory answers this discrepancy

## Electronic Configurations of Transition Metal Complexes

Filling electron shells via CH 221:

- lowest energy vacant orbitals are occupied first
- electrons fill degenerate orbitals singly until no longer possible (Hund's rule), then pair (Pauli Exclusion)

These rules help minimize repulsions between electrons.
These rules work well for gas-phase transition metal ions, but they are not always followed by transition metal complexes in a ligand field

## Electronic Configurations of Transition Metal Complexes

For complexes in a ligand field, d orbital occupancy depends on $\Delta$ and pairing energy, P

- Electrons assume the configuration with the lowest possible energy "cost"
- If $\Delta>P$ ( $\Delta$ large; strong field ligand), e-'s pair up in lower energy d subshell first, referred to as a low spin complex
- If $\Delta<\mathrm{P}$ ( $\Delta$ small; weak field ligand), e-'s spread out among all d orbitals before any pair up, referred to as a high spin complex

## Example with $\mathbf{C o}\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}$

 <br> The absorbance spectrum of $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}$ is shown to the right. <br> What is the name of the complex? <br> What is the coordination number? <br>  <br> 3. How many d electrons does the complex possess? <br> 4. Will this be a high spin or low spin complex? <br> 5. Is the compound paramagnetic? <br> 6. What is the value of $\Delta$ for this complex? <br> 7. What will be the observed color of the complex? What color is absorbed?}

## Example with $\mathbf{C o}\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}$

3. How many d electrons does the complex possess?

Cobalt(III) ions have the electron configuration:
[ Ar$] 3 \mathrm{~d}^{6}$ (two $4 s$ and 13 d electron removed)
This complex has six d electrons ( $\mathbf{d}^{6}$ )
4. Will this be a high spin or low spin complex?

To answer this, we need to look at the spectrochemical series.
$\mathrm{NH}_{3}$ is considered a strong field ligand, which implies that $\Delta$, the splitting energy, will be greater than the electron pairing energy ( P ).
The octahedral $\mathrm{NH}_{3}$ ligand field makes this a low spin complex

## Electronic Configurations of Transition Metal Complexes

To determine which d-orbital energy level diagram to use on a complex or compound:
$\boldsymbol{\lambda}$ determine the oxidation \# of the metal
$\boldsymbol{\lambda}$ determine the \# of de's
$\boldsymbol{\lambda}$ determine if ligand is weak field or strong field
$\boldsymbol{\lambda}$ draw energy level diagram

## Example with $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6^{3+}}$

1. What is the name of the complex?

Each ammonia is neutral; hence, this is a cobalt(III) complex
Ammonia is named "ammine"; hence,
Name $=$ hexaamminecobalt(III) ion
2. What is the coordination number?

There are six monodentate ammonia ligands around the cobalt(III) ion; hence, this is a six coordinate compound, or the coordination number $=6$

## Example with $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}$

5. Is the compound paramagnetic?

This is a $\mathrm{d}^{6}$ low spin complex in an octahedral field.
Three degenerate $d$ orbitals are filled first, followed by the remaining two orbitals.
Since each orbital holds two electrons, the three lower orbitals are full and the complex is diamagnetic

6. What is the value of $\Delta$ for this complex?

Notice that $\lambda_{\text {max }}=500 . \mathrm{nm}$ in the spectrum, and
technically this is a question asking for $\Delta$ since the complex is in an octahedral field
$\Delta_{\mathrm{O}}=\Delta \mathrm{E}=\mathrm{h} v=\mathrm{hc} / \lambda_{\text {max }}$
$\Delta_{\mathrm{O}}=6.626 * 10^{-34} \mathrm{~J} \mathrm{~s} * 2.998 * 10^{8} \mathrm{~m} \mathrm{~s}^{-1} / 500 . * 10^{-9} \mathrm{~m}$
$\Delta_{0}=3.97 * 10^{-19} \mathrm{~J}$ or
$\Delta_{\mathrm{O}}=239 \mathrm{~kJ} / \mathrm{mol}$
d-orbital energy level diagrams for tetrahedral complexes

d-orbital energy level diagrams for square planar complexes

Example with $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}^{3+}$
7. What will be the observed color of the complex?

What color is absorbed?
Since $\lambda_{\text {max }}$ is $500 . \mathrm{nm}$ in the spectrum, this is the wavelength that is absorbed.
Using $500 . \mathrm{nm}$, the chart to the right implies that the complex is absorbing the color green
The complementary color is the color that is actually observed by our eyes. Red is opposite green, so the observed color should be red

Which statement describes the composition of

Nitrogen and oxygen form a series of oxides with the general formula $\mathrm{N}_{\mathrm{x}} \mathrm{O}_{\mathrm{y}}$. One of them has $46.67 \% \mathrm{~N}$. The empirical formula for this oxide is
A. $\mathrm{N}_{2} \mathrm{O}$
B. NO
C. $\mathrm{NO}_{2}$
D. $\mathrm{N}_{2} \mathrm{O}_{3}$
E. $\mathrm{N}_{2} \mathrm{O}_{5}$
a neutral atom of iron-58?
A. 26 neutrons, 32 protons, and 26 electrons
B. 32 neutrons, 26 protons, and 26 electrons
C. 26 neutrons, 26 protons, and 32 electrons
D. 26 neutrons, 26 protons, and 26 electrons
E. Not enough information

Ammonia is prepared by the reaction:

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

If 10.0 mol of $\mathrm{N}_{2}$ are mixed with 25.0 mol of $\mathrm{H}_{2}$, the amount of $\mathrm{NH}_{3}$ produced will be:
A. $20.0 \mathrm{~mol} \mathrm{NH}_{3}$
B. $16.7 \mathrm{~mol} \mathrm{NH}_{3}$
C. $37.5 \mathrm{~mol} \mathrm{NH}_{3}$
D. $25.0 \mathrm{~mol} \mathrm{NH}_{3}$
E. $35.0 \mathrm{~mol} \mathrm{NH}_{3}$

Which of the compounds below would be the best conductor of electricity in aqueous solution?
A. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$
B. $\mathrm{H}_{3} \mathrm{PO}_{4}$
C. $\mathrm{NH}_{3}$
D. HBr
E. HIO

Which equation below best represents the balanced net ionic equation for the reaction of potassium hydroxide and iron(II) chloride to give iron(II) hydroxide and potassium chloride?
A. $2 \mathrm{KOH}(\mathrm{aq})+\mathrm{FeCl}_{2}(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{KCl}(\mathrm{aq})$
B. $2 \mathrm{KOH}(\mathrm{aq})+\mathrm{FeCl}_{2}(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{aq})+2 \mathrm{KCl}(\mathrm{aq})$
C. $2 \mathrm{OH}^{-}(\mathrm{aq})+\mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{~s})$
D. $\mathrm{K}^{+}(\mathrm{aq})+\mathrm{Cl}-(\mathrm{aq}) \rightarrow \mathrm{KCl}(\mathrm{aq})$

Under what conditions will the ideal gas law be least effective?
A. high temperature and high pressure
B. high temperature and low pressure
C. Iow temperature and high pressure
D. low temperature and low pressure
E. it works all the time

Which water-based solution is expected to have the higher boiling point?
A. 0.10 molal NaCl
B. 0.15 molal sugar
C.both the same
D.not enough
information

In the diagram for NaCl , the smaller blue atoms are Na and the larger green atoms are Cl . How many nearest neighbors of Cl does each Na have?
A. 8
B. 6
C. 4
D. 2
E. 1

MAR

Erythritol occurs naturally in algae and fungi. A solution of 2.50 g of erythritol in 50.0 g of water freezes at $-0.762{ }^{\circ} \mathrm{C}$. What is the molar mass of the
compound? $\left(\mathrm{k}_{\mathrm{fp}}\left(\mathrm{H}_{2} \mathrm{O}\right)=-1.86{ }^{\circ} \mathrm{C} / \mathrm{m}\right)$
A. $26.9 \mathrm{~g} / \mathrm{mol}$
B. $35.5 \mathrm{~g} / \mathrm{mol}$
C. $122 \mathrm{~g} / \mathrm{mol}$
D. $224 \mathrm{~g} / \mathrm{mol}$
E. $0.0100 \mathrm{~g} / \mathrm{mol}$

MAR

Using the graph, determine the half life of this reaction. determine the rate expression for the reaction.

| $[\mathrm{A}](\mathrm{M})$ | $[\mathrm{B}](\mathrm{M})$ | $\Delta[\mathrm{C}] / \Delta \mathrm{t}(\mathrm{M} / \mathrm{s})$ |
| :--- | :--- | :--- |
| 0.10 | 0.20 | 40. |
| 0.20 | 0.20 | 80. |
| 0.10 | 0.10 | 40. |
| A. $\Delta[\mathrm{C}] / \Delta \mathrm{t}=2000[\mathrm{~A}][\mathrm{B}]$ |  |  |
| B. $\Delta[\mathrm{C}] / \Delta \mathrm{t}=40 .[\mathrm{A}]$ |  |  |
| C. $\Delta[\mathrm{C}] / \Delta \mathrm{t}=4.0[\mathrm{~B}]$ |  |  |
| D. $\Delta[\mathrm{C}] / \Delta \mathrm{t}=400[\mathrm{~A}]$ |  |  |
| E. $\Delta[\mathrm{C}] / \Delta \mathrm{t}=\# 1[\mathrm{AC} / \mathrm{DC}]$ |  |  |

A. 654 minutes
B. 1308 minutes
C. 1962 minutes
D. 2616 minutes

E. 0 minutes

Radioactive iodine-131 is used to treat
hyperthyroidism. It has a half-life of 8.04 days. If you begin with 8.8 micrograms, what mass remains after 32.3 days?
A. 4.4 micrograms
B. 2.2 micrograms
C. 1.1 micrograms
D. 0.54 micrograms
E. 0.23 micrograms

What is the unknown particle in the following nuclear reaction?

$$
{ }_{92}^{239} \mathrm{U} \rightarrow \text { particle }+{ }_{93}^{239} \mathrm{~Np}
$$

A. alpha
B. beta
C. gamma
D. neutron
E. positron

The reaction of $\mathrm{NO}_{2}(\mathrm{~g})$ and $\mathrm{CO}(\mathrm{g})$ is thought to occur in two steps.

| Step 1 Slow | $\mathrm{NO}_{2}(\mathrm{~g})+\mathrm{NO}_{2}(\mathrm{~g}) \rightarrow \mathrm{NO}(\mathrm{g})+\mathrm{NO}_{3}(\mathrm{~g})$ |
| :--- | :--- |
| Step 2 Fast | $\mathrm{NO}_{3}(\mathrm{~g})+\mathrm{CO}(\mathrm{g}) \rightarrow \mathrm{NO}_{2}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})$ |

Which species is acting as a catalyst in this mechanism?
A. $\mathrm{NO}_{2}$
B. NO
C. CO
D. $\mathrm{CO}_{2}$
E. $\mathrm{NO}_{3}$

## Types of Equilibrium Constants in CH 223

$\mathbf{K}_{\mathbf{a}} \quad$ Acid Dissociation Constant (Chapter 14)
For the reaction: $\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \Leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{A}^{-}$,

$$
\mathrm{K}_{\mathrm{a}}=\frac{\left.\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \mathrm{A}^{-}\right]}{[\mathrm{HA}]}
$$

$\mathbf{K}_{\mathbf{b}} \quad$ Base Dissociation Constant (Chapter 14)
For the reaction: $\mathrm{B}^{-}+\mathrm{H}_{2} \mathrm{O}<=>\mathrm{OH}^{-}+\mathrm{HB}$,

$$
\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{OH}^{-}\lceil\mathrm{HB}]\right.}{\left[\mathrm{B}^{-}\right]}
$$

$\mathbf{K}_{\mathbf{c}}$ Equilibrium Constant using Molarity (Chapter 13)
For the reaction: $\mathrm{a} A+\mathrm{b}$ B $<=>\mathrm{c} C+\mathrm{d} \mathrm{D}$,

$$
\mathrm{K}_{\mathrm{c}}=\frac{[\mathrm{C}]^{\mathrm{c}}[\mathrm{D}]^{\mathrm{d}}}{[\mathrm{~A}]^{\mathrm{a}}[\mathrm{~B}]^{\mathrm{b}}}
$$

$\mathbf{K}_{\mathbf{f}} \quad$ Formation Constant (Chapter 14 and 15)
For the reaction: $\mathrm{M}^{2+}+4 \mathrm{~L}_{(\mathrm{aq})} \ll \mathrm{ML}_{4}{ }^{2+}$,

$$
\mathrm{K}_{\mathrm{f}}=\frac{\left[\mathrm{ML}_{4}^{2+}\right]}{\left[\mathrm{M}^{2+}\right][\mathrm{L}]^{4}}
$$

$\mathbf{K}_{\mathbf{p}} \quad$ Equilibrium Constant using Pressure (atm) (Chapter 13)
For the reaction: $1 / 2 \mathrm{~N}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})}<=>\mathrm{NO}_{2(\mathrm{~g})}$,

$$
\mathrm{K}_{\mathrm{p}}=\frac{\mathrm{P}_{\mathrm{NO}_{2}}}{\mathrm{P}_{\mathrm{N}_{2}}^{0.5} \mathrm{P}_{\mathrm{O}_{2}}}
$$

Also: $\mathrm{K}_{\mathrm{p}}=\mathrm{K}_{\mathrm{c}}(\mathrm{RT})^{\Delta \mathrm{n}}$
$\mathbf{K}_{\text {sp }}$ Solubility Product Constant (Chapter 15).
For the reaction: $\mathrm{ML}_{2(\mathrm{~s})}<=>\mathrm{M}^{2+}+2 \mathrm{~L}^{-}$,

$$
K_{\mathrm{sp}}=\left[\mathrm{M}^{2+} \mathrm{L}^{-}\right]^{2}
$$

$\mathbf{K}_{\text {spa }} \underline{\text { Solubility Product Constant in Acid (Chapter 15) }}$
For the reaction: $\mathrm{ZnS}_{(\mathrm{s})}+2 \mathrm{H}_{3} \mathrm{O}^{+} \ll>\mathrm{Zn}^{2+}+\mathrm{H}_{2} \mathrm{~S}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$,

$$
\mathrm{K}_{\mathrm{spa}}=\frac{\left.\left[\mathrm{Zn}^{2+}\right] \mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}
$$

$\mathbf{K}_{\mathbf{w}} \quad$ Autoionization of Water Constant (Chapter 14) For the reaction: $2 \mathrm{H}_{2} \mathrm{O}_{(1)}<\Rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}$,

$$
\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\left[\mathrm{OH}^{-}\right]=1.00 * 10^{-14} \text { at } 25^{\circ} \mathrm{C}\right.
$$

$\boldsymbol{k} \quad$ Kinetics Rate Constant (Chapter 12). The forward reaction $\left(\boldsymbol{k}_{\boldsymbol{I}}\right)$ and the reverse reaction $\left(\boldsymbol{k}_{-1}\right)$ are related to the equilibrium constant, $\mathbf{K}$, by

$$
\mathrm{K}=\frac{k_{1}}{k_{-1}}
$$

Q Reaction Quotient (Chapter 13, 15, and 17), for non-equilibrium calculations. Q is defined in a method similar to that of K .

## Understanding $K$ and $Q$ in CH 223

For the reaction: $\mathbf{a} \mathbf{A}_{(\mathrm{aq})}+\mathbf{b} \mathbf{B}_{(\mathrm{aq})} \ll \mathbf{c C}_{(\mathrm{aq})}+\mathbf{d} \mathbf{D}_{(\mathrm{aq})}$, the equilibrium constant, $\mathbf{K}$, is defined as:

$$
\mathbf{K}=\frac{[\mathbf{C}]^{\mathbf{c}}[\mathrm{D}]^{\mathbf{d}}}{[\mathbf{A}]^{\mathbf{a}}[\mathbf{B}]^{\mathbf{b}}}
$$

## If $K \gg 1$, the reaction is product favored

Equilibrium concentrations of products are greater than the equilibrium concentrations of reactants

## If $K \ll 1$, the reaction is reactant favored

Equilibrium concentrations of reactants are greater than the equilibrium concentrations of products

## If $K=1$, the concentration of products equals the concentration of reactants

This condition is extremely rare and will not be seen in CH 223.
The Reaction Quotient, $\mathbf{Q}$, is used to compare experimental conditions to equilibrium positions.
$\mathbf{Q}$ is a ratio of concentrations similar to the definition of $\mathbf{K}$, above.
The concentrations for $\mathbf{K}$ should be at equilibrium, while the concentrations given for $\mathbf{Q}$ may not be at equilibrium.

- If $\mathbf{Q}>\mathbf{K}$, the reaction is not at equilibrium, and the reaction will move to the reactants.
- If $\mathbf{Q}<\mathbf{K}$, the reaction is not at equilibrium, and the reaction will move to the products.
- If $\mathbf{Q}=\mathbf{K}$, the reaction is at equilibrium

# Manipulating Equilibrium Constant Expressions 

Remember, for the reaction: $\quad \mathbf{a} \mathbf{A}_{(\mathrm{aq})}+\mathbf{b} \mathbf{B}_{(\mathrm{aq})} \ll \mathbf{c} \mathbf{C}_{(\mathrm{aq})}+\mathbf{d} \mathbf{D}_{(\mathrm{aq})}$,

$$
\mathbf{K}_{\mathbf{c}}=\frac{[\mathbf{C}]^{\mathbf{c}}[\mathbf{D}]^{\mathrm{d}}}{[\mathbf{A}]^{\mathrm{a}}[\mathbf{B}]^{\mathbf{b}}}
$$

- Products in numerator, reactants in denominator
- Raise the stoichiometric value to the same factor for each species present
- Only gases and dissolved species appear in equilibrium constant expressions
- Solids and liquids do not appear in equilibrium constant expressions
- Remember to watch for units!

1. Do not include solids and liquids in equilibrium calculations, only gases and dissolved species Example 1: $\quad \mathbf{C}_{(\mathrm{s})}+1_{2} \mathbf{O}_{2(\text { aq) }} \ll \mathrm{CO}_{(\mathrm{aq})}$

$$
\mathrm{K}_{1}=\frac{[\mathrm{CO}]}{\left[\mathrm{O}_{2}\right]^{1 / 2}}=4.6^{*} 10^{23} \mathrm{M}^{1 / 2} \text { at } 25^{\circ} \mathrm{C}
$$

2. If doubling reaction, square $K$; if tripling, cube $K$; etc.

Example 2: $\mathbf{2 C}_{(\mathrm{s})}+\mathbf{O}_{\mathbf{2 ( a q )}} \Leftrightarrow \mathbf{C O}_{(\mathrm{aq})}$

$$
\mathrm{K}_{2}=\frac{[\mathrm{CO}]^{2}}{\left[\mathrm{O}_{2}\right]}=\left(\mathrm{K}_{1}\right)^{2}=\left(\mathbf{4 . 6}{ }^{* 10} 0^{23}\right)^{2}=2.1^{*} \mathbf{1 0}^{47} \mathrm{M} \text { at } 25^{\circ} \mathrm{C}
$$

Also, if reaction*3, $\mathrm{K}=\left(\mathrm{K}_{1}\right)^{3}$; if reaction halved, $\mathrm{K}=\left(\mathrm{K}_{1}\right)^{1 / 2}$; etc.
3. If reactants and products are "flipped", take $1 / K$ for new value..

Example 3: $\quad \mathbf{C O}_{(\mathrm{aq})} \Leftrightarrow \mathrm{C}_{(\mathrm{s})}+1 / \mathbf{O}_{2(\mathrm{aq})}$

$$
\mathbf{K}_{3}=\frac{\left[\mathrm{O}_{2}\right]^{1 / 2}}{[\mathbf{C O}]}=\frac{1}{\mathbf{K}_{1}}=\frac{1}{4.6 * 10^{23}}=2.2^{* 10^{-24}} \mathbf{M}^{-1 / 2} \text { at } 25^{\circ} \mathrm{C}
$$

4. Temperature changes will affect the value of $K$ by either adding or subtracting from the original value. Example 4: $\quad \mathbf{C}_{(\mathrm{s})}+\mathbf{1} / \mathbf{2}_{\mathbf{2}(\mathrm{aq})} \Leftrightarrow \mathbf{C O}_{(\mathrm{aq})}$

$$
\mathbf{K}_{4}=\frac{[\mathrm{CO}]}{\left[\mathrm{O}_{2}\right]^{1 / 2}}=9.7^{*} 10^{23} \mathbf{M}^{1 / 2} \text { at } 37^{\circ} \mathrm{C}
$$

5. Reactions in the gas phase use $K_{p}$ expressions which are similar to $K_{c}$ expressions Example 5: $\quad \mathbf{C}_{(\mathrm{s})}+1_{2} \mathbf{O}_{\mathbf{2 ( \mathrm { g } )}} \Leftrightarrow \mathrm{CO}_{(\mathrm{g})}$

$$
\begin{aligned}
& \mathbf{K}_{5}=\frac{\mathbf{P}_{\mathbf{C O}}}{\mathbf{P}_{\mathbf{O}_{2}}^{1 / 2}}=\mathbf{K}_{\mathbf{p}}, \text { and if at } 25^{\circ} \mathrm{C}(298 \mathrm{~K}), \\
& \mathbf{K}_{\mathbf{p}}=\mathbf{K}_{\mathbf{c}}(\mathbf{R T})^{\mathrm{n}}=4.6^{*} * 10^{23}(0.082057 * 298)^{1-1 / 2}=\mathbf{2 . 3} * \mathbf{1 0}^{\mathbf{2 4}} \mathbf{a t m}^{\mathbf{1 / 2}} \\
& R=\text { gas constant, } T=\text { Kelvin temperature, } P \text { in atm }
\end{aligned}
$$

6. If adding reactions, multiply the respective $K$ values together

$$
\begin{array}{rll}
\text { Example 6: } & \mathbf{C}_{(\mathrm{s})}+1 / \mathbf{O}_{2(\mathrm{aq})} \ll \mathbf{C O}_{(\mathrm{aq})} & \mathbf{K}_{1} \\
& \mathbf{C O}_{(\mathrm{aq})}+1 / \mathbf{O}_{2(\mathrm{aq})}<=\mathbf{C O}_{2(\mathrm{aq})} & \mathbf{K}_{6} \\
& --\cdots--\cdots \mathbf{C O}_{2(\mathrm{aq})} & \mathbf{K}_{7}
\end{array}
$$

Assume at $25^{\circ} \mathrm{C}$ :
$\mathbf{K}_{7}=\mathbf{K}_{1} * \mathbf{K}_{6}=\frac{[\mathbf{C O}]}{\left[\mathbf{O}_{2}\right]^{1 / 2}} * \frac{\left[\mathbf{C O}_{2}\right]}{\left[\mathbf{C O}\left[\mathbf{O}_{2}\right]^{1 / 2}\right.}=\left(4.6 * 10^{23}\right)\left(1.7 * 10^{15}\right)=\mathbf{7 . 8} * \mathbf{1 0}^{\mathbf{3 8}}$ unitless

Le Chatelier's Principle: "If a stress is applied to a system, the system will change in a manner to reduce the stress"
CH 223 Guide to Le Chatelier's Principle

## CH 223 Chapter Thirteen Study Guide

- Know the nature of equilibrium (reversible reactions, dynamic processes, etc.) Realize that while many chemical reactions are in equilibrium, many are simple "oneway" reactions as well.
- Be able to write an equilibrium constant expression for any reaction. Know how to find $\mathrm{K}_{\mathrm{c}}$ or $\mathrm{K}_{\mathrm{p}}$ given the appropriate information.
- Recognize that solids and liquids are not included in equilibrium constant expressions. Know how the expression can change depending on the stoichiometry of the reaction.
- Know how to convert $\mathrm{K}_{\mathrm{c}}$ to $\mathrm{K}_{\mathrm{p}}$ given appropriate information.
- Know the difference between initial concentration and equilibrium concentration. Be able to find the equilibrium constant based on this information.
- Understand the effect on $K$ when two chemical reactions are combined together. Know the effect on K when the reaction is reversed, or when the reaction stoichiometry is doubled.
- Know when a value of K should be "product favored" or "reactant favored".
- Realize the importance of the reaction quotient, Q , when deciding if the reaction is at equilibrium. Be able to predict the progress of the reaction based on the value of Q .
- Be able to apply Le Chatelier's principle to predict the effect of a disturbance on a chemical equilibrium (change in temperature, change in concentration, change in volume, change in pressure, effect of exothermic or endothermic reactions, etc.)
- Understand the relationship between a reaction mechanism and on the kinetics of a reaction if one step in the mechanism involves a chemical equilibrium.
- Be able to solve and understand the assigned problems in problem set \#1.

## Brønsted Acids and Bases

A Brønsted Acid will donate a proton, while a Brønsted Base will accept a proton

$$
\underset{\text { base }}{\mathbf{N H}_{3}}+\underset{\text { acid }}{\mathbf{H}_{2} \mathbf{O}}<=>\underset{\text { acid }}{\mathbf{N H}_{4}^{+}}+\underset{\text { base }}{\mathrm{OH}^{-}}
$$

A base produces a conjugate acid upon acceptance of a proton An acid produces a conjugate base upon release of a proton
Acids do not create conjugate acids, and bases do not create conjugate bases

Some acids and bases are polyprotic - more than one proton can be released or accepted.

Example: Sulfuric acid is a diprotic acid
$\mathrm{H}_{2} \mathrm{SO}_{4}->\mathrm{HSO}_{4}^{-}+\mathrm{H}^{+}$
$\mathrm{HSO}_{4}^{-}->\mathrm{SO}_{4}{ }^{2-}+\mathrm{H}^{+}$
$\mathrm{H}_{2} \mathrm{SO}_{4}->\mathrm{SO}_{4}{ }^{\mathbf{2 -}}+\mathbf{2} \mathrm{H}^{+}$
Example: Magnesium hydroxide is a diprotic base
$\mathrm{Mg}(\mathrm{OH})_{2}->2 \mathrm{OH}^{-}+\mathrm{Mg}^{2+}$
$2 \mathrm{OH}^{-}+2 \mathrm{H}^{+}->2 \mathrm{H}_{2} \mathrm{O}$
$\mathbf{M g}(\mathbf{O H})_{2}+2 \mathbf{H}^{+}->2 \mathbf{H}_{2} \mathrm{O}+\mathbf{M g}^{2+}$
Strong Acids and Strong Bases are completely ionized.
Weak Acids and Weak Bases have equilibrium constants, $\mathbf{K}$, less than one. Use your textbook as a source of K values for acids and bases.

## CH 223 Chapter Fourteen Part I Study Guide

- Know the three major acid-base theories discussed in the chapter.
- Be able to identify and name common strong and weak acids and bases.
- Be familiar with the Arrhenius theory of acids.
- Be able to recognize common monoprotic and polyprotic acids and bases. Know how to write balanced equations for their ionization in water.
- Know the definition of amphiprotic.
- Be able to recognize Brønsted acids and bases in reactions.
- Know the definition of conjugate and know how it applies to acids and bases.
- Know how to use values of $\underline{K}_{\underline{a}}$ and $\underline{K}_{\underline{b}}$ to predict the relative strengths of acids and bases
- Know how to predict when an acid-base reaction is reactant- or product-favored.
- MEMORIZE the value of $\mathrm{K}_{\mathrm{w}}$. the water autoionization constant.
- Be able to calculate $\mathbf{p H}$ and $\mathbf{p O H}$ for a solution. Know how to find $\left[\mathrm{H}^{+}\right]$or $\left[\mathrm{OH}^{-}\right]$ from pH or pOH .
- Be able to calculate equilibrium constants using $\mathrm{K}_{\mathrm{a}}, \mathrm{K}_{\mathrm{b}}, \mathrm{pH}, \mathrm{pOH}$, etc.
- Be able to describe the acid-base properties of salts and calculate the pH of salt solutions.
- Understand the importance of the Lewis concept of acids and bases. Know what qualifies as a Lewis acid or a Lewis base.
- Be able to solve and understand the assigned problems in problem set \#2.

## Buffers \& Henderson-Hasselbalch

The three things you need to know about buffers are:

1) A buffer consists of a weak acid with its conjugate base (or a weak base with its conjugate acid). Strong acids and bases do not form buffers.

Examples: $\quad \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H} / \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{Na}$ could be a buffer system $\mathrm{NH}_{3} / \mathrm{NH}_{4} \mathrm{Cl}$ could be a buffer system
$\mathrm{HCl} / \mathrm{NaCl}$ would not be a buffer system (strong acid)
$\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H} / \mathrm{NH}_{3}$ would not be a buffer system (not conjugates)
2) Although you can use the "long" method using equilibrium concentrations, etc., the Henderson-Hasselbalch equation will almost always be much easier to utilize.

The Henderson-Hasselbalch equation:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { Conj. base }]}{[\text { acid }]}
$$

where $\quad \mathrm{pH}=\mathrm{pH}$ of system
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log$ (acid dissociation constant for weak acid in buffer)
[Conj. base] = concentration or moles of base in solution
[acid] = concentration or moles of acid in solution
For the Henderson-Hasselbalch equation to be effective, the ratio of [conj. base]/[acid] must be no larger than 10 and no less than 0.1 .

Example: What is the pH of a buffer with $\left[\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right]=0.700 \mathrm{M}$ and $\left[\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}\right]=$ $0.600 \mathrm{M} ? \mathrm{~K}_{\mathrm{a}}$ for acetic acid $=1.8^{*} 10^{-5}$
$\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log \left(1.8^{*} 10^{-5}\right)=4.74$
Now use the Henderson-Hasselbalch equation:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { Conj. base }]}{[\text { acid }]}=4.74+\log \frac{[0.600]}{[0.700]}=4.67
$$

3) When selecting an appropriate buffer, choose a $\mathrm{pK}_{\mathrm{a}}$ value which is close to the desired pH of your buffer. This maintains the appropriate Henderson-Hasselbalch ratio and makes your calculations must easier.

Example: If a buffer with a pH of 4.5 was desired, acetic acid and sodium acetate would be a good system to use. As observed in $\# 2, \mathrm{pK}_{\mathrm{a}}$ for acetic acid is 4.74 this is close to $\mathrm{pH}=4.5$, so this would be a good system.

Example: If a buffer with a pH of 4.5 was desired, potassium hydrogen phosphate and potassium phosphate would not be a good system to use. The weak acid here is potassium hydrogen phosphate; the $\mathrm{K}_{\mathrm{a}}$ is $3.6^{*} 10^{-13}$, or $\mathrm{pK}=12.44$ - too basic for our desired acidic pH of 4.5.

## Buffer Calculations upon Addition of Strong Acids or Bases

The Henderson-Hasselbalch equation can give you more than just the pH of solutions; it can also tell you what the pH of the solution will be upon addition of strong acid or strong base.

Example: As we saw earlier, the pH of a buffer with $\left[\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right]=0.700 \mathrm{M}$ and $\left[\mathrm{CH}_{3} \mathrm{CO}_{2}^{-1}\right]=0.600 \mathrm{M}$ is $4.67\left(\mathrm{pK}_{\mathrm{a}}=4.74\right)$ What will the pH be upon the addition of 10.00 mL of 1.00 M HCl ? Assume 1.00 L of buffer before addition of HCl .

Remember that the Henderson-Hasselbalch equation works equally well for concentrations as well as moles. In calculations involving the addition of strong acids or bases, it is better to use moles.
moles of $\mathrm{HCl}=0.01000 \mathrm{~L} * 1.00 \mathrm{M}=0.0100 \mathrm{~mol} \mathrm{HCl}$
mol weak acid $=1.00 \mathrm{~L} * 0.700 \mathrm{M}=0.700 \mathrm{~mol}$ acetic acid
mol conjugate base $=1.00 \mathrm{~L} * 0.600 \mathrm{M}=0.600 \mathrm{~mol}$ acetate ion
Every mole of strong acid will eliminate one mol of the conjugate base, but it will also create one mole of the weak acid:

$$
\begin{array}{llll} 
& \mathrm{CH}_{3} \mathrm{CO}_{2}^{-1}+\mathrm{H}^{+} & -> & \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H} \\
\text { initial moles: } & 0.600 & 0.0100 & 0.700 \\
\text { final moles: } & 0.590 & 0 & 0.710
\end{array}
$$

You can then re-calculate the pH using the Henderson-Hasselbalch equation and the new concentrations:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { Conj. base }]}{[\text { acid }]}=4.74+\log \frac{[0.590]}{[0.710]}=4.66
$$

Note that the buffer solution become more acidic upon addition of HCl ; this makes intuitive sense, since HCl is a strong acid.

For the addition of strong acids, you can re-write the Henderson-Hasselbalch equation:

Example: Calculate the pH of a 1.00 L buffer with $\left[\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right]=0.700 \mathrm{M}$ and $\left[\mathrm{CH}_{3} \mathrm{CO}_{2}^{-1}\right]=0.600 \mathrm{M}, \mathrm{pK}_{\mathrm{a}}=4.74$, if 15.00 mL of 2.10 M NaOH is added?

Use moles with the Henderson-Hasselbalch equation as before.
moles of $\mathrm{NaOH}=0.01500 \mathrm{~L} * 2.10 \mathrm{M}=0.0315 \mathrm{~mol} \mathrm{NaOH}$ mol weak acid $=1.00 \mathrm{~L} * 0.700 \mathrm{M}=0.700 \mathrm{~mol}$ acetic acid mol conjugate base $=1.00 \mathrm{~L} * 0.600 \mathrm{M}=0.600 \mathrm{~mol}$ acetate ion

Every mole of strong base will eliminate one mol of the weak acid, but it will also create one mole of the conjugate base:

|  | $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}+$ | $\mathrm{OH}^{-}->$ | $\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O}$ |
| :--- | :--- | :--- | :--- |
| initial moles: | 0.700 | 0.0315 | 0.600 |
| final moles: | 0.669 | 0 | 0.632 |

You can then re-calculate the pH using the Henderson-Hasselbalch equation and the new concentrations:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { Conj. base }]}{[\text { acid }]}=4.74+\log \frac{[0.632]}{[0.669]}=4.72
$$

Note that the buffer solution become more basic upon addition of NaOH ; this makes intuitive sense, since sodium hydroxide is a strong base.

For the addition of strong base, you can re-write the Henderson-Hasselbalch equation:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left(\mathrm{mol}_{\text {Conj. base }}+\mathrm{mol}_{\text {strong base }}\right)}{\left(\mathrm{mol}_{\text {weak acid }}-\mathrm{mol}_{\text {strong base }}\right)}
$$

## Buffer Calculations Using Weak Bases \& Conj. Acids

The Henderson-Hasselbalch equation can be re-written to accommodate buffers which incorporate a weak base and its conjugate acid. The new expression would be:

$$
\mathrm{pOH}=\mathrm{pK}_{\mathrm{b}}-\log \frac{[\text { base }]}{[\text { Conj. acid }]}
$$

The buffer calculations are similar to those above for buffers with weak acids and conjugate bases. $\mathrm{pK}_{\mathrm{b}}=-\log \mathrm{K}_{\mathrm{b}}$, etc. Remember to switch to pH from pOH if using this version of the Henderson-Hasselbalch equation.

## CH 223 Chapter Fourteen Part II Study Guide

- Be able to predict the pH of an acid-base reaction at the equivalence point:

| Acid | Base | $\mathbf{p H}$ at equivalence point |
| :--- | :--- | :--- |
| Strong Acid | Strong Base | $\mathrm{pH}=7$ (neutral) |
| Strong Acid | Weak Base | $\mathrm{pH}<7$ (acidic) |
| Weak Acid | Strong Base | $\mathrm{pH}>7$ (basic) |
| Weak Acid | Weak Base | depends on the magnitudes of $\mathrm{K}_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ |

- Know the definition of equivalence point.
- Be able to calculate the pH at the equivalence point for the above acid - base examples.
- Be able to predict the effect on pH of adding a common ion using the idea behind the common ion effect.
- Understand how a buffer works.
- Be able to calculate the pH of a buffer solution before and after adding an acid or a base.
- Know how to use the Henderson-Hasselbalch Equation to calculate the pH of a buffer solution. Know how to utilize the equation upon changes in buffer composition.
- Know how to create a buffer of a given pH in the lab.
- Be able to calculate the pH at any point along a titration curve. This includes before adding any titrant (the initial point), during the period before equivalence point, at the equivalence point, and after the equivalence point.
- Understand the differences between titration curves for strong acids - strong bases and when using a strong - weak combination.
- Be able to describe how indicators can assist in acid-base titrations.
- Be able to solve and understand the assigned problems in problem set \#3.

## CH 223 Guide to Solubility Calculations

The extent to which an insoluble salt dissolves can be expressed in terms of the equilibrium constant. For lead(II) iodide, the expression can be written as:

$$
\mathrm{PbI}_{2(\mathrm{~s})}<=>\mathrm{Pb}_{(\mathrm{aq})}^{+2}+2 \mathrm{I}_{(\mathrm{aq})}^{-} \quad \mathrm{K}_{\text {sp }}=\left[\mathrm{Pb}^{+2}\right]\left[\mathrm{I}^{-}\right]^{2}
$$

The equilibrium constant, $\mathrm{K}_{\mathrm{sp}}$, is called the solubility product constant or simply the solubility constant. The concentration of the solid, $\mathrm{PbI}_{2(5)}$, is omitted from the equilibrium expression because it is a constant - all solids and liquids are removed from equilibrium constants.

The solubility of any compound can be observed graphically using the following diagram:

As solid is first introduced to the system, it is immediately dissolved until a certain threshold value is obtained - here referred to as " $\mathrm{K}_{\text {sp }}$ ". Past the threshold, the solid is insoluble in the solution - no more dissolves. Each solvent has a certain capacity to dissolve solute, and the threshold value signifies the limit of the solvent to dissolve the solid solute.

Examples of typical solubility calculations follow.

1. If 55 mg of lead(II) sulfate are placed in 250. mL of pure water, what mass of the lead compound remains undissolved?

In a lead(II) sulfate solution, $\mathrm{K}_{\text {sp }}=1.8 * 10^{-8}$. The amount that dissolves, x (which is also referred to as the solubility of $\mathrm{PbSO}_{4}$ ), can be expressed using $\mathrm{K}_{\mathrm{sp}}$ :

$$
\begin{gathered}
\mathrm{K}_{\text {sp }}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]=\mathrm{x}^{*} \mathrm{x}=\mathrm{x}^{2}, \text { and } \\
\mathrm{x}=\left(\mathrm{K}_{\text {sp }}\right)^{0.5}=\left(1.8^{*} 10^{-8}\right)^{0.5}=1.3 * 10^{-4} \mathrm{M}
\end{gathered}
$$

This is the amount that dissolves in solution; i.e. the concentration of both lead(II) ions and sulfate ions will equal $1.3 * 10^{-4} \mathrm{M}$ at equilibrium.

This concentration can be converted to grams:

$$
\begin{gathered}
\left(1.3 * 10^{-4} \mathrm{~mol} \text { ions } / \mathrm{L}\right) * 0.250 \mathrm{~L} *\left(1 \mathrm{~mol} \mathrm{PbSO}_{4} / 1 \mathrm{~mol} \mathrm{ions}\right) *\left(303 \mathrm{~g} \mathrm{PbSO}_{4} / \mathrm{mol} \mathrm{PbSO}_{4}\right)= \\
0.010 \mathrm{~g} *\left(10^{3} \mathrm{mg} / \mathrm{g}\right)=\mathbf{1 0 .} \mathbf{~ m g ~ P b S O} 4
\end{gathered}
$$

This answer means that $10 . \mathrm{mg}$ of lead(II) sulfate will dissolve in $250 . \mathrm{mL}$ of water. If 55 mg of lead(II) sulfate are placed in $250 . \mathrm{mL}$ of water, only $10 . \mathrm{mg}$ will dissolve. Therefore, at equilibrium

$$
55 \mathrm{mg}-10 . \mathrm{mg}=\mathbf{4 5} \mathbf{~ m g} \text { undissolved } \mathrm{PbSO}_{4}
$$

Note that if only 7 mg of $\mathrm{PbSO}_{4}$ were placed in $250 . \mathrm{mL}$ of water, all of it would dissolve. 10. mg is the threshold for the $\mathrm{PbSO}_{4}$ system; if less than $10 . \mathrm{mg}$ is added, all of it dissolves, and if more than $10 . \mathrm{mg}$ is added, only $10 . \mathrm{mg}$ of it will dissolve and the remainder will exist as solid precipitate.
2. A solution contains $\mathrm{Ca}^{2+}$ and $\mathrm{Pb}^{2+}$ ions, both at a concentration of 0.010 M. If sodium sulfate is added, which metal ion precipitates first? What is the concentration of the first ion to precipitate as the second more soluble ion begins to precipitate?

The first step is to determine the salts that will be precipitating; these are $\mathrm{CaSO}_{4} \quad\left(\mathrm{~K}_{\text {sp }}=\right.$ $2.4^{*} 10^{-5}$ ) and $\mathrm{PbSO}_{4}\left(\mathrm{~K}_{\text {sp }}=1.8^{*} 10^{-8}\right)$. To find which one will precipitate first, we need to calculate the concentration of the sulfate ion necessary to initiate precipitation:

$$
\begin{aligned}
& \text { For } \mathrm{PbSO}_{4}:\left[\mathrm{SO}_{4}{ }^{2-}\right]=\mathrm{K}_{\text {sp }} /\left[\mathrm{Pb}^{2+}\right]=1.8^{*} 10^{-8} / 0.010=\mathbf{1 . 8}^{*} \mathbf{1 0}^{\mathbf{- 6}} \mathbf{M} \\
& \underline{\text { For } \mathrm{CaSO}_{4}}:\left[\mathrm{SO}_{4}{ }^{2-}\right]=\mathrm{K}_{\text {sp }} /\left[\mathrm{Ca}^{2+}\right]=2.4^{*} 10^{-5} / 0.010=\mathbf{2 . 4}^{*} \mathbf{1 0}^{-\mathbf{3}} \mathbf{M}
\end{aligned}
$$

The concentration of sulfate required to precipitate $\mathrm{PbSO}_{4}$ is much less than the concentration of sulfate required to precipitate $\mathrm{CaSO}_{4}$; hence, $\mathrm{PbSO}_{4}$ will begin to precipitate out of solution before $\mathrm{CaSO}_{4}$ begins to precipitate.

To calculate the concentration of $\mathrm{Pb}^{2+}$ present in solution once $\mathrm{CaSO}_{4}$ begins to precipitate, we need to use the concentrations of sulfate ion determined previously. $\left[\mathrm{SO}_{4}{ }^{2-}\right]=2.4^{*} 10^{-3} \mathrm{M}$ when $\mathrm{CaSO}_{4}$ begins to precipitate, and we can use this value in the $\mathrm{K}_{\text {sp }}$ expression for $\mathrm{PbSO}_{4}$ :

$$
\left[\mathbf{P b}^{2+}\right]=\mathrm{K}_{\text {sp }} /\left[\mathrm{SO}_{4}{ }^{2-}\right]=1.8^{*} 10^{-8} / 2.4^{*} 10^{-3} \mathrm{M}=\mathbf{7 . 5} * \mathbf{1 0}^{-\mathbf{6}} \mathbf{M}
$$

Notice how the concentration of lead(II) ions decreased from an initial value of 0.010 M to $7.5^{*} 10^{-6} \mathrm{M}$ once $\mathrm{CaSO}_{4}$ began to precipitate.
3. Sodium hydroxide is added dropwise to a solution containing 0.1 M concentrations of $\mathrm{Fe}^{3+}$, $\mathrm{Pb}^{2+}$ and $\mathrm{Al}^{3+}$. What is the order by which the hydroxide salts begin to precipitate?

First, find the $\mathrm{K}_{\text {sp }}$ values for the relevant hydroxide complexes.

$$
\begin{aligned}
& \mathrm{Fe}(\mathrm{OH})_{3}: \mathrm{K}_{\mathrm{sp}}=6.3^{*} 10^{-38}=\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{OH}^{-1}{ }^{3}\right. \\
& \mathrm{Pb}(\mathrm{OH})_{2}: \mathrm{K}_{\text {sp }} 2.8^{*} 10^{-16}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{OH}^{-1}\right]^{2} \\
& \mathrm{Al}(\mathrm{OH})_{3}: \mathrm{K}_{\mathrm{sp}}=1.9^{*} 10^{-33}=\left[\mathrm{Al}^{3+}\right]\left[\mathrm{OH}^{-1}\right]^{3}
\end{aligned}
$$

Next, calculate the concentration of hydroxide necessary to initiate precipitation in each of the salts. Remember to account for the different forms of each $\mathrm{K}_{\mathrm{sp}}$ expression.

For $\mathrm{Fe}(\mathrm{OH})_{3}:\left[\mathbf{O H}^{-1}\right]=\left(\mathrm{K}_{\text {sp }} /\left[\mathrm{Fe}^{3+}\right]\right)^{1 / 3}=\left(6.3 * 10^{-38} / 0.1\right)^{1 / 3}=\mathbf{8 . 6} * \mathbf{1 0}^{-13} \mathbf{M}$
For $\mathrm{Pb}(\mathrm{OH})_{2}:\left[\mathrm{OH}^{-1}\right]=\left(\mathrm{K}_{\text {sp }} /\left[\mathrm{Pb}^{2+}\right]\right)^{1 / 2}=\left(2.8^{*} 10^{-16} / 0.1\right)^{1 / 2}=\mathbf{5 . 3} \mathbf{3}^{-8} \mathbf{1 0}^{-8} \mathbf{M}$
For $\mathrm{Al}(\mathrm{OH})_{3}:\left[\mathbf{O H}^{-1}\right]=\left(\mathrm{K}_{\text {sp }} /\left[\mathrm{Al}^{3+}\right]\right)^{1 / 3}=\left(1.9 * 10^{-33} / 0.1\right)^{1 / 3}=\mathbf{2 . 7 *} \mathbf{1 0}^{-11} \mathbf{M}$
$\mathrm{Fe}^{3+}$ requires the least amount of $\mathrm{OH}^{-1}$ (only $8.6^{*} 10^{-13} \mathrm{M}$ ) begin precipitation; hence, $\mathrm{Fe}(\mathbf{O H})_{3}$ will precipitate first. The second ion to begin precipitating will be $\mathrm{Al}(\mathbf{O H})_{3}$, followed by $\mathbf{P b}(\mathbf{O H})_{2}$ which takes the most hydroxide $\left(5.3 * 10^{-8} \mathrm{M}\right)$ to begin precipitating.

## CH 223 Chapter Fifteen Study Guide

- Be able to write the solubility product constant expression $\left(\mathrm{K}_{\mathrm{sp}}\right)$ for any insoluble salt. Recall the solubility tables from CH 221 - what do you think of them now?
- Be able to calculate $\mathrm{K}_{\mathrm{sp}}$ values from experimental data.
- Know how to estimate the solubility of a salt from the value of $\mathrm{K}_{\mathrm{sp}}$.
- Be able to use the values of different $\mathrm{K}_{\mathrm{sp}}$ s to predict the order of precipitation amongst various salts.
- Know how to decide if a precipitate forms when the ion concentrations are known using Q values.
- Be able to calculate the ion concentrations required to begin the precipitation of an insoluble salt.
- Be familiar with the concept of the common ion effect, and be able to calculate the solubility of a salt in the presence of a common ion.
- Know how to use $\mathrm{K}_{\mathrm{sp}}$ values to devise a method of separating ions in solution from one another. This will become quite important during the last three labs of CH 223.
- Realize the differences between the solubility product constant and the formation constant $\left(\mathrm{K}_{\mathrm{f}}\right)$. Know the definition of a complex ion and be able to recognize a complex ion in a reaction.
- Know that pH can affect the solubility of certain salts when basic anions are present. Be able to predict which salts should be soluble in strong acids, and know that most metal cations form "insoluble" hydroxide complexes (with the exception of the alkali metals and alkaline earths.)
- Recognize the reason for the quotation marks around "insoluble" in the above statement. Are the metal hydroxide salts truly insoluble? Do you recognize the reason for my scorn of the "solubility tables" from Chapter Five?
- Be able to solve and understand the assigned problems in problem set \#4.

## Understanding Entropy in CH 223

Entropy, $\mathbf{S}$, is a measure of the disorder of a system. According to the second law of thermodynamics, the total entropy of the universe is continually increasing, so everything we do as chemists and as human beings must somehow be increasing the quantity of disorder in the universe.

The third law of thermodynamics states that the entropy of each element in some crystalline state at zero Kelvin equals zero. Realize that the chances of finding any element in this idealized (and vague!) crystalline state at 0 K is about zero, so everything has some measure of entropy to it; viz., the entropy of every substance will be greater than zero at temperatures greater than zero Kelvin.

Some generalizations regarding entropy:

1) The entropy of gases is greater than the entropy of liquids, and the entropy of liquids is greater than the entropy of solids.

Example: $\quad \mathrm{H}_{2} 0_{(\mathrm{g})}$ : $\mathrm{S}=188.8 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
Example: $\quad \mathrm{H}_{2} \mathrm{O}_{\mathrm{( })}: \mathrm{S}=69.9 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
2) The entropy of complex molecules is greater than the entropy of simple molecules.

$$
\text { Example: } \quad \mathrm{C}_{3} \mathrm{H}_{8(\mathrm{~g})}: \mathrm{S}=269.9 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

Example: $\quad \mathrm{C}_{2} \mathrm{H}_{6(\mathrm{~g})}: \mathrm{S}=229.6 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
Example: $\quad \mathrm{CH}_{4(\mathrm{~g})}: \mathrm{S}=186.3 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
3) In ionic solids, the weaker the ionic charges, the higher the entropy.

$$
\begin{array}{ll}
\text { Example: } & \mathrm{MgO}_{(\mathrm{s}}: \mathrm{S}=26.9 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \\
\text { Example: } & \mathrm{NaF}_{(s)}: \mathrm{S}=51.5 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \\
\text { Example: } & \mathrm{CH}_{4(\mathrm{~g})}: \mathrm{S}=186.3 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
\end{array}
$$

4) Entropy usually increases when pure liquids or solids dissolve in a solvent.
5) When dissolved gases escape from a solution, entropy usually increases.
6) By the second law of thermodynamics,

$$
\Delta S_{\text {universe }}=\Delta S_{\text {system }}+\Delta S_{\text {surroundings }}
$$

Occasional localized decreases in entropy are acceptable as long as the overall entropy of the universe continues to increase.

## The Gibbs Free Energy Equations \& Relations

| $\Delta \mathrm{G}=-\mathrm{T} \Delta \mathrm{S}_{\text {universe }}$ | Relates Gibbs Free Energy ( $\Delta \mathrm{G}$ ) with the entropy of the universe ( $\Delta \mathrm{S}_{\mathrm{u}}$ $\qquad$ ). By the second law of thermodynamics, $\Delta \mathrm{S}_{\text {univese }}$ must always increase; therefore, $\Delta \mathrm{G}$ must be negative for product favored reactions. |
| :---: | :---: |
| $\Delta G=\Delta H-T \Delta S$ | Relates $\Delta \mathrm{G}$ to enthalpy ( $\Delta \mathrm{H}$ ) and entropy ( $\Delta \mathrm{S}$ ); also known as the "two headed snake" equation. Enthalpy and entropy can combine to make some reactions always product favored ( $\Delta \mathrm{G}<0$ ) or always reactant favored ( $\Delta \mathrm{G}>0$ ); in addition, sometimes enthalpy and entropy "fight" one another, making the final value of $\Delta \mathrm{G}$ temperature dependent. |
| $\Delta G=-R T \ln K$ | Relates $\Delta \mathrm{G}$ with the equilibrium constant ( K ). $\mathrm{R}=$ gas constant ( $8.3145 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ ), $\mathrm{T}=$ temperature ( K ). If $\Delta \mathrm{G}$ is product favored $(\Delta \mathrm{G}<0)$, K is greater than 1 ; if $\Delta \mathrm{G}$ is reactant favored ( $\Delta \mathrm{G}>0$ ), K is less than 1 . |
| $\Delta \mathrm{G}=-\mathrm{nFE}$ | Relates $\Delta \mathrm{G}$ with the potential of a chemical cell (E). $\mathrm{n}=$ number of electrons transferred, $\mathrm{F}=$ Faraday constant $\left(96,485 \mathrm{C} \mathrm{mol}^{-1}\right)$. If $\Delta \mathrm{G}$ is product favored $(\Delta \mathrm{G}<0), \mathrm{E}$ is greater than 0 (positive); if $\Delta \mathrm{G}$ is reactant favored ( $\Delta \mathrm{G}>0$ ), E is less than 0 (negative). |
| $\Delta G=\Sigma \Delta G_{\text {products }}-\Sigma \Delta G_{\text {reactants }}$ | Used to calculate the Gibbs Free Energy ( $\Delta \mathrm{G}$ ) for a reaction using tables of standardized $\Delta \mathrm{G}$ values. Like enthalpy, $\Delta \mathrm{G}$ will be zero for elements in their standard states $\left(\mathrm{O}_{2(\mathrm{~g})}, \mathrm{Mg}_{(\mathrm{s})}\right.$, $\mathrm{Br}_{2(1)}$, etc. - all will have $\Delta \mathrm{G}=0$ ). |

|  | $\Delta \mathbf{G}$ | $\mathbf{K}$ | $\mathbf{E}$ | $\Delta \mathbf{S}_{\text {universe }}$ |
| :---: | :---: | :---: | :---: | :---: |
| Product Favored | - | $>1$ | + | + |
| Reactant Favored | + | $<1$ | - | - |

| $\Delta \mathbf{H}$ | $\Delta \mathbf{S}$ | $\Delta \mathbf{G}$ |
| :---: | :---: | :---: |
| - | $\mathbf{+}$ | - (always product favored) |
| $\mathbf{+}$ | - | $\boldsymbol{+}$ (always reactant favored) |
| $\mathbf{-}$ | $\mathbf{-}$ | Depends on temperature, generally <br> product favored at low T |
| $\mathbf{+}$ | $\mathbf{+}$ | Depends on temperature, generally <br> product favored at high T |

## CH 223 Chapter Sixteen Study Guide

- Be able to describe the differences between kinetics and thermodynamics. What does each provide? How can they compliment each other?
- Realize that entropy is a measure of matter and/or energy dispersal. Entropy is often synonymous with disorder.
- Be able to predict the sign of the entropy change for a reaction of a change in state.
- Be able to calculate the entropy change for a change of state or for a chemical reaction.
- Recall past lectures concerning enthalpy - what is it, how it is measured, etc.
- Be able to use entropy and enthalpy changes to predict whether a reaction is productor reactant- favored.
- Understand the subtle difference between Gibbs Free Energy and the entropy of the universe. Know how this applies to the second law of thermodynamics.
- Realize the connection between entropy, enthalpy and Gibbs Free energy. Know the definition of spontaneity and know how it applies to Gibbs free energy.
- Be able to calculate a change of entropy, enthalpy and/or Gibbs free energy from the reactants and products.
- Be able to determine the relationship between the free energy change for a reaction and its equilibrium constant.
- Be able to determine the temperature at which a reaction can become product favored, if applicable.
- Be able to solve and understand the assigned problems in problem set \#4 \& \#5.

## ( " $q \& d$ ") Redox Reactions Guide for CH 223

"q\&d" = "Quick 'n' Dirty"
Part I: General Instructions - for reactions where pH is not important

1) Recognize that the reaction is an oxidation-reduction reaction. Look for changes in oxidation number on similar atoms in both the reactant and product side.

Example: $\quad \mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{H}_{2} \mathrm{O}_{(1)}+\mathrm{NaCl}$ not an oxidation-reduction reaction Example: $\quad \mathrm{Ag}^{+}+\mathrm{Cu}_{(\mathrm{s})}->\mathrm{Ag}_{(\mathrm{s})}+\mathrm{Cu}^{2+} \quad$ oxidation-reduction
2) Separate the process into two half-reactions. One side will be a reduction and the other will be an oxidation.

Example: $\quad \mathrm{Ag}^{+}->\mathrm{Ag}_{(\mathrm{s})}$

$$
\mathrm{Cu}_{(\mathrm{s})}->\mathrm{Cu}^{2+}
$$

3) Balance each half-reaction for mass (atoms) and charge (using electrons).

Example: $\quad \mathrm{Ag}^{+}+\mathrm{e}^{-}->\mathrm{Ag}_{(\mathrm{s})} \quad$ reduction
$\mathrm{Cu}_{(\mathrm{s})}->\mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \quad$ oxidation
4) Multiply each half-reaction by a factor that makes the number of electrons equal.

$$
\begin{array}{ll}
\text { Example: } & \mathrm{Ag}^{+}+\mathrm{e}^{-}->\mathrm{Ag}_{(\mathrm{s})} \\
& \mathrm{Cu}_{(\mathrm{s})}->\mathrm{Cu}^{2+}+2 \mathrm{e}^{-}
\end{array}
$$

If we multiply the first reaction by $\mathbf{2}$ and the second reaction by $\mathbf{1}$, the number of electrons in each half-reaction will be equal.
$2 \mathrm{Ag}^{+}+2 \mathrm{e}^{-}->2 \mathrm{Ag}_{(\mathrm{s})}$
$\mathrm{Cu}_{\text {(s) }}->\mathrm{Cu}^{2+}+2 \mathrm{e}^{-}$
5) Add the two half-reactions to create the overall balanced equation. The equation should be balanced for mass and devoid of electrons.

$$
\begin{array}{ll}
\text { Example: } & 2 \mathrm{Ag}^{+}+2 \mathrm{e}^{-}->2 \mathrm{Ag}_{(\mathrm{s})} \\
& \mathrm{Cu}_{(\mathrm{s})}->\mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \\
& --\cdots-----------\mathbf{A g}_{(\mathrm{s})}+\mathbf{C u}^{2+}
\end{array}
$$

6) Confirm that mass and charge are balanced in the overall equation.

Example: 2 silver atoms on reactant and product side
1 copper atom on reactant and product side mass balanced
$2(+1)=+2$ charge on reactant side +2 charge on product side charge balanced

## Part II: Acidic Conditions - for reactions where pH<7

1) Recognize that the reaction is an oxidation-reduction reaction. Look for changes in oxidation number on similar atoms in both the reactant and product side.

$$
\text { Example: } \quad \mathrm{VO}_{2}^{+}+\mathrm{Zn}_{(\mathrm{s})}->\mathrm{VO}^{2+}+\mathrm{Zn}^{2+} \quad \text { oxidation-reduction }
$$

2) Separate the process into two half-reactions. One side will be a reduction and the other will be an oxidation.

$$
\begin{array}{ll}
\text { Example: } & \mathrm{VO}_{2}^{+}->\mathrm{VO}^{2+} \\
& \mathrm{Zn}_{(\mathrm{s})}->\mathrm{Zn}^{2+}
\end{array}
$$

3) Balance each half-reaction for mass (atoms) and charge (using electrons). Note that in acidic solution, mass can be balanced by using water and $\mathrm{H}^{+}$if appropriate. Water will go to the side that is oxygen deficient, and hydrogen ions will go to the side that is hydrogen deficient. Some halfreactions will not need any water or hydrogen ions.
$\begin{array}{lll}\text { Example: } & 2 \mathrm{H}^{+}+\mathrm{VO}_{2}^{+}+\mathrm{e}^{-}->\mathrm{VO}^{2+}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} & \text { reduction } \\ & \mathrm{Zn}_{(\mathrm{s})}->\mathrm{Zn}^{2+}+2 \mathrm{e}^{-} & \text {oxidation }\end{array}$
4) Multiply each half-reaction by a factor that makes the number of electrons equal.
$\begin{array}{ll}\text { Example: } & 2 \mathrm{H}^{+}+\mathrm{VO}_{2}^{+}+\mathrm{e}^{-}->\mathrm{VO}^{2+}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \\ & \mathrm{Zn}_{(\mathrm{s})}->\mathrm{Zn}^{2+}+2 \mathrm{e}^{-}\end{array}$
If we multiply the first reaction by $\mathbf{2}$ and the second reaction by $\mathbf{1}$, the number of electrons in each half-reaction will be equal.

$$
\begin{aligned}
& 4 \mathrm{H}^{+}+2 \mathrm{VO}_{2}^{+}+2 \mathrm{e}^{--}->2 \mathrm{VO}^{2+}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \\
& \mathrm{Zn}_{(\mathrm{s})}->\mathrm{Zn}^{2+}+2 \mathrm{e}^{-}
\end{aligned}
$$

5) Add the two half-reactions to create the overall balanced equation. The equation should be balanced for mass \& devoid of electrons. Cancel water and/or protons if present on both sides of the equation.

$$
\begin{aligned}
& \text { Example: } \quad 4 \mathrm{H}^{+}+2 \mathrm{VO}_{2}^{+}+2 \mathrm{e}^{-}->2 \mathrm{VO}^{2+}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \\
& \mathrm{Zn}_{(\mathrm{s})}->\mathrm{Zn}^{2+}+2 \mathrm{e}^{-} \\
& 4 \mathrm{H}^{+}+2 \mathrm{VO}_{2}^{+}+\mathrm{Zn}_{(\mathrm{s})}->2 \mathrm{VO}^{2+}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}+\mathrm{Zn}^{2+}
\end{aligned}
$$

6) Confirm that mass and charge are balanced in the overall equation.

Example: 4 hydrogen atoms on each side
2 vanadium atoms on each side
4 oxygen atoms on each side
1 zinc atom on each side
mass balanced
$4(+1)+2(+1)=+6$ charge on reactant side
$2(+2)+2=+6$ charge on product side
charge balanced

## Part III: Basic Conditions - for reactions where $\mathrm{pH}>7$

1) Recognize that the reaction is an oxidation-reduction reaction. Look for changes in oxidation number on similar atoms in both the reactant and product side.

Example: $\quad \mathrm{MnO}_{4}^{-}+\mathrm{HO}_{2}^{-}->\mathrm{MnO}_{4}{ }^{2-}+\mathrm{O}_{2} \quad$ oxidation-reduction
2) Separate the process into two half-reactions. One will be a reduction and the other an oxidation.

Example: $\quad \mathrm{MnO}_{4}^{-}->\mathrm{MnO}_{4}{ }^{2-}$
$\mathrm{HO}_{2}^{-}->\mathrm{O}_{2}$
3) Balance each half-reaction for mass (atoms) and charge (using electrons). Note that in basic solution, mass can be balanced by using water and $\mathrm{OH}^{-}$if appropriate. Hydroxide will go to the side that is oxygen deficient, and water will go to the side that is hydrogen deficient. Some half-reactions will not need any water or hydrogen ions.

```
Example: \(\quad \mathrm{MnO}_{4}^{-}+\mathrm{e}^{-}->\mathrm{MnO}_{4}{ }^{2-}\) reduction
    \(\mathrm{OH}^{-}+\mathrm{HO}_{2}^{-}->\mathrm{O}_{2}+2 \mathrm{e}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{I})} \quad\) oxidation
```

4) Multiply each half-reaction by a factor that makes the number of electrons equal.
```
Example: \(\quad \mathrm{MnO}_{4}^{-}+\mathrm{e}^{-}->\mathrm{MnO}_{4}{ }^{2-}\)
    \(\mathrm{OH}^{-}+\mathrm{HO}_{2}^{-}->\mathrm{O}_{2}+2 \mathrm{e}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}\)
```

    If we multiply the first reaction by \(\mathbf{2}\) and the second reaction by \(\mathbf{1}\), the number
                    of electrons in each half-reaction will be equal.
    $2 \mathrm{MnO}_{4}^{-}+2 \mathrm{e}^{-}->2 \mathrm{MnO}_{4}^{2-}$
$\mathrm{OH}^{-}+\mathrm{HO}_{2}^{-}->\mathrm{O}_{2}+2 \mathrm{e}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$
5) Add the two half-reactions to create the overall balanced equation. The equation should be balanced for mass and devoid of electrons. Cancel water and/or hydroxide if present on both sides of the equation.

$$
\begin{array}{ll}
\text { Example: } & 2 \mathrm{MnO}_{4}^{-}+2 \mathrm{e}^{-}->2 \mathrm{MnO}_{4}^{2-} \\
& \mathrm{OH}^{-}+\mathrm{HO}_{2}^{-}->\mathrm{O}_{2}+2 \mathrm{e}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \\
& ----------------\mathbf{M n O}_{4}^{2-}+\mathbf{O}_{2}+\mathbf{H}_{2} \mathbf{O}_{(\mathrm{I})}
\end{array}
$$

6) Confirm that mass and charge are balanced in the overall equation.

Example: 2 manganese atoms on each side
11 oxygen atoms on each side
2 hydrogen atoms on each side - mass balanced
$2(-1)+(-1)+(-1)=-4$ charge on reactant side
$2(-2)=-4$ charge on product side - charge balanced
7) Alternatively, you may balance basic redox reactions using the acidic process used in Part II. Upon completing step 5 , add $\mathrm{OH}^{-}$to neutralize any $\mathrm{H}^{+}$present. Add a similar amount of $\mathrm{OH}^{-}$to both sides. All of the $\mathrm{H}^{+}$will be converted to $\mathrm{H}_{2} \mathrm{O}$, and the opposite side should have $\mathrm{OH}^{-}$present.

## The Nernst Equation

Not all systems are at equilibrium when measured. Slow kinetics, adding or removing of substrate, and other factors can keep the system from attaining equilibrium - for a while.

Values of $\mathrm{E}^{\mathrm{o}}$ are applicable only to equilibrium conditions. To calculate cell potentials for nonequilibrium systems, we use the Nernst Equation:

$$
E=E^{0}-(R T / n F) \ln Q
$$

where $\quad \mathrm{E}=$ cell potential $(\mathrm{V})$ at nonstandard conditions
$\mathrm{E}^{\mathrm{o}}=$ cell potential ( V ) at standard equilibrium conditions
$\mathrm{R}=\mathrm{Gas}$ constant ( $8.314 \mathrm{~J} / \mathrm{K} \mathrm{mol}$ )
$\mathrm{T}=$ Temperature (K)
F = Faraday constant ( $96,485 \mathrm{C} / \mathrm{mol} \mathrm{e}$ e)
$\mathrm{n}=$ the number of moles of electrons transferred
$\mathrm{Q}=$ reaction quotient; for the reaction: $\mathrm{a}_{(\mathrm{aq})}+\mathrm{bB}_{(\mathrm{aq})} \Leftrightarrow=>\mathrm{c}_{(\mathrm{aq})}+\mathrm{d} \mathrm{D}_{(\mathrm{aq})}$,

$$
\text { then } \mathbf{Q}=\frac{[\mathbf{C}]^{\mathbf{c}}[\mathbf{D}]^{\mathbf{d}}}{[\mathbf{A}]^{\mathbf{a}}[\mathbf{B}]^{\mathbf{b}}}
$$

Example: Find $\mathbf{E}$ when $\left[\mathrm{Zn}^{2+}\right]=0.0010 \mathrm{M}, \mathrm{P}\left(\mathrm{H}_{2}\right)=0.10$ atm and $\mathrm{pH}=0$ at 298 K .

$$
\left[\mathbf{H}^{+}\right]=10^{-\mathrm{pH}} \mathrm{M}=10^{-0} \mathrm{M}=\mathbf{1 . 0} \mathbf{M} ; \text { note that } \mathbf{n}=\mathbf{2}
$$

$$
\begin{aligned}
& \mathrm{Zn}_{(\mathrm{s})}--->\mathrm{Zn}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{e}^{-} \quad \mathrm{E}^{0}=0.76 \mathrm{~V} \\
& 2 \mathrm{H}^{+} \text {(aq) }+ \text { 2e------------------------------------------------------ } \\
& \mathbf{2} \mathbf{H}_{(\mathrm{aq})}^{+}+\mathbf{Z n}_{(\mathrm{s})}-\mathrm{-l}^{->} \mathbf{Z n}_{(\mathrm{aq})}^{2+}+\mathbf{H}_{\mathbf{2 ( g )}} \quad \quad \mathrm{E}_{\text {net }}{ }^{0}=0.76 \mathrm{~V}
\end{aligned}
$$

Use the Nernst equation to find E :

$$
\begin{aligned}
& \mathrm{E}=\mathrm{E}^{\mathrm{o}}-(\mathrm{RT} / \mathrm{nF}) \ln \mathrm{Q} \\
& \mathrm{Q}=\frac{\left[\mathrm{Zn}^{2+}\right] \mathrm{P}_{\mathrm{H}_{2}}}{\left[\mathrm{H}^{+}\right]^{2}}=\left[0.0010 * 0.10 /(1.0)^{2}\right]=0.00010 \\
& \mathrm{E}=0.76 \mathrm{~V}-(8.314 * 298 \mathrm{~K} / 2 * 96500) \ln 0.00010 \\
& \mathrm{E}=0.76 \mathrm{~V}+0.12 \mathrm{~V}=\mathbf{0 . 8 8} \mathbf{~ V}
\end{aligned}
$$

## CH 223 Chapter Seventeen Study Guide

- Be able to define and use the terms battery, electrochemical cell, fuel cell, electrolysis, electrode, electrolyte, salt bridge, anode and cathode.
- MEMORIZE the value of the Faraday Constant, $\mathrm{F}=96,485 \mathrm{C} \mathrm{mol}^{-1}$ electrons.
- Be able to balance oxidation-reduction reactions in acidic or basic solutions using the half-reaction approach.
- Realize the internal workings of an electrochemical cell.
- Be able to appreciate the meaning of standard electrode potential and its connection to the free energy change for a cell reaction. Know the meaning of the SHE in electrochemistry.
- Realize that product favored reactions have a positive E value while reactant favored reactions have a negative E value.
- Know that when a half-reaction or net electrochemical reaction is reversed, the sign of $E$ is reversed but its value does not change.
- Know how to compare two chemical species for the relative strength of oxidizing agents.
- Recognize that electrochemical potentials depend on the nature of the reactants and products and their concentrations, not their quantities of material used.
- Be able to use the Nernst equation to calculate the cell potential under nonstandard conditions.
- Be able to calculate the equilibrium constant for a reaction from the value of E .
- Be able to describe the difference between electrolysis of an electrolyte and the operation of a galvanic or voltaic cell.
- Know how to use the relationship between current, electric charge, and time and occasionally the Faraday constant.
- Be able to solve and understand the assigned problems in problem set \#5.

## CH 223 Chapter Eighteen Study Guide

- Identify the main group metals, metalloids and non-metals. Be able to predict properties for each of these classifications.
- Know the general periodic properties for each of the classifications listed above.
- Realize which reactions produce ionic compounds and which will probably produce covalent compounds.
- Be able to predict formulas for common ions using their electron configuration and oxidation number.
- Know where to find information regarding a series of main group elements, including bonding character (ionic or covalent), color, solubility ("like attracts like"), simple reaction chemistry, etc.
- Realize the importance of chemicals in the daily lives of human beings. Understand how the chemistry relates to the usage of the product.
- Be able to solve and understand the assigned problems in problem set \#6.

## Coordination Compounds Nomenclature Guide

1) In naming a coordination compound that is a salt, name the cation first and the anion second.
2) When giving the name of the complex ion or molecule, name the ligands first, in alphabetical order, followed by the name of the metal.
a. If a ligand is an anion whose name ends in -ite or -ate, the final $e$ is changed to $o$

Example: "sulfate" becomes "sulfato", "nitrate" becomes "nitrato", etc.
b. If a ligand is an anion whose name ends in -ide, the -ide is changed to $o$

Example: "chloride" becomes "chloro", "cyanide" becomes "cyano", etc.
c. If a ligand is a neutral molecule, its common name is usually used.

Exceptions: water becomes aqua
ammonia becomes ammine
carbon monoxide becomes carbonyl
d. When more than one simple monodentate ligand, use di, tri, tetra, etc. prefix.
e. When more than one complex ligand, use bis, tris, tetrakis, pentakis, etc. prefix.
3) If the complex ion is an anion, the suffix -ate is added to the metal name.
4) Following the name of the metal, the oxidation number of the metal is given in Roman numerals.

## Examples of Coordination Compounds:

$\left[\mathrm{Ni}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \mathrm{SO}_{4} \quad$ Hexaaquanickel(II) sulfate
$\mathrm{K}_{2}\left[\mathrm{CoCl}_{4}\right] \quad$ Potassium tetrachlorocobaltate(II)
$\mathrm{Ba}\left[\mathrm{BrF}_{4}\right]_{2} \quad$ Barium tetraflurobromate(III)
$\mathrm{Li}\left[\mathrm{CrF}_{4} \mathrm{O}\right] \quad$ Lithium tetrafluorooxochromate(V)
$\left[\mathrm{Ru}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{~N}_{2}\right] \mathrm{Cl}_{2} \quad$ Pentaamminedinitrogenruthenium(II) chloride
$\mathrm{K}\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}\right] \quad$ Potassium amminetrichloroplatinate(II)
$\mathrm{Co}(\text { phen })_{2} \mathrm{Cl}_{2}$
Dichlorobis(phenanthroline)cobalt(II)

## CH 223 Chapter Nineteen Study Guide

- Identify the transition elements, the $d$-block elements, the lanthanide elements, the actinide elements, and the $f$-block elements. Be able to predict properties for each of these classifications.
- Know how to determine if an element is paramagnetic or diamagnetic.
- Be able to describe and identify coordination compounds. Know how to determine the oxidation number for a coordination compound.
- Know what a ligand is and whether it is monodentate, bidentate or polydentate.
- Understand why there are no cationic coordination compounds.
- Know what EDTA is.
- Know how to systematically name coordination complexes using the rules outlined in the handout.
- Be able to determine the coordination number for a coordination compound. Know the differences between octahedral, square planar and tetrahedral complexes.
- Understand the definition of an isomer. Realize that there are two types of isomers, both geometrical and optical.
- Know the terms cis, trans, mer, and fac. Know how they apply to isomerism in coordination compounds.
- Be able to explain briefly the differences between molecular orbital theory and crystal field theory.
- Know what differentiates between high spin and low spin complexes.
- Understand why coordination compounds are colored and how the complex can be explained using the crystal field model of bonding.
- Be able to solve and understand the assigned problems in problem set \#6.
- Realize that this is the last chapter study guide that you will ever see in a Chem 22 x class! On to the final exam and summer break!!!

## CH 223 Chapter Thirteen Concept Guide

## 1. Writing Equilibrium Constant Expressions

## Problem

Write the equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ expressions for each of the following reactions:
(a) $\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s}) \rightleftarrows \mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})$
(b) $\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}{ }^{2+}(\mathrm{aq}) \rightleftarrows \mathrm{Cu}^{2+}(\mathrm{aq})+4 \mathrm{NH}_{3}(\mathrm{aq})$
(c) $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{CH}_{3} \mathrm{CO}_{2}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$

## Solution

(a) $\mathrm{K}_{\mathrm{c}}=\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}$
(b)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{Cu}^{2}+\right]\left[\mathrm{NH}_{3}\right]^{4}}{\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}{ }^{2+}\right]}
$$

(c)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right]}
$$

## 2. Writing Equilibrium Constant Expressions

## Problem

Write the equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ expressions for each of the following reactions:
(a)
$\mathrm{CO}(\mathrm{g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{CO}_{2}(\mathrm{~g})$
(b) $\mathrm{C}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{CO}(\mathrm{g})$
(c) $\mathrm{FeO}(\mathrm{s})+\mathrm{CO}(\mathrm{g}) \rightleftarrows \mathrm{Fe}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$

## Solution

(a)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CO}_{2}\right]}{[\mathrm{CO}]\left[\mathrm{O}_{2}\right]^{1 / 2}}
$$

(b)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CO}^{2}\right.}{\left[\mathrm{CO}_{2}\right]}
$$

(c)
$\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CO}_{2}\right]}{[\mathrm{CO}]}$

## 3. Writing Equilibrium Constant Expressions

## Problem

Write the equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ expressions for each of the following reactions:
(a) $\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{NO}(\mathrm{g})$
(b) $2 \mathrm{NO}(\mathrm{g})+\mathrm{Br}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{NOBr}(\mathrm{g})$
(c) $2 \mathrm{HF}(\mathrm{g}) \rightleftarrows \mathrm{H}_{2}(\mathrm{~g})+\mathrm{F}_{2}(\mathrm{~g})$

## Solution

(a)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{NO}^{2}\right.}{\left[\mathrm{N}_{2}\right]\left[\mathrm{O}_{2}\right]}
$$

(b)

$$
\mathrm{K}_{\mathrm{c}}=\frac{[\mathrm{NOBr}]^{2}}{\left[\mathrm{NO}^{2}\left[\mathrm{Br}_{2}\right]\right.}
$$

(c)

$$
\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{H}_{2}\right]\left[\mathrm{F}_{2}\right]}{[\mathrm{HF}]^{2}}
$$

## 4. Interpreting the Value of $K$

## Question

A student's task was to remove silver ion for an aqueous solution as completely as possible by causing it to form a precipitate. Given the following information, which would be the better method: to add a solution containing sulfate ion or one containing an equivalent amount of sulfide ion?

$$
\mathrm{Ag}_{2} \mathrm{SO}_{4}(\mathrm{~s}) \rightleftarrows 2 \mathrm{Ag}^{+}+\mathrm{SO}_{4}^{2-} \quad \mathrm{K}=1.5 \times 10^{-5}
$$

$$
\mathrm{Ag}_{2} \mathrm{~S}(\mathrm{~s}) \rightleftarrows 2 \mathrm{Ag}^{+}+\mathrm{S}^{2-} \quad \mathrm{K}=7.1 \times 10^{-50}
$$

## Solution

The precipitates formed would be silver sulfate and silver sulfide upon addition of sulfate ion or sulfide ion, respectively. Comparison of the equilibria that would result after precipitate formation using the two K values shows that the sulfide would leave a far lower concentration of $\mathrm{Ag}^{+}$in solution after the precipitation reaction went to completion. Thus, the student should choose the silver and sulfide reaction:

$$
\mathrm{Ag}_{2} \mathrm{~S}(\mathrm{~s}) \rightleftarrows 2 \mathrm{Ag}^{+}+\mathrm{S}^{2-}
$$

## 5. Manipulation of Equilibrium Expressions

## Question

Consider the following equilibria involving $\mathrm{SO}_{2}(\mathrm{~g})$ and their corresponding equilibrium constants.
(1) $\mathrm{SO}_{2}(\mathrm{~g})+{ }_{1}{ }_{2} \mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{SO}_{3}(\mathrm{~g}) \quad \mathrm{K}_{1}$
(2) $2 \mathrm{SO}_{3}(\mathrm{~g}) \rightleftarrows 2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \quad \mathrm{K}_{2}$

Which of the following expressions relates $\mathrm{K}_{1}$ to $\mathrm{K}_{2}$ ?
(a) $\mathrm{K}_{2}=\mathrm{K}_{1}{ }^{2}$
(b) $\mathrm{K}_{2}{ }^{2}=\mathrm{K}_{1}$
(c)

$$
\mathrm{K}_{2}=\frac{\mathrm{l}}{\mathrm{~K}_{1}}
$$

(d)

$$
\mathrm{K}_{2}=\frac{\mathrm{l}}{\mathrm{~K}_{1}^{2}}
$$

## Solution

Reaction 2 is the inverse of reaction 1, and squared. Thus, (d) is the correct answer. $K_{2}$ is related to $K_{1}$ by:

$$
\mathrm{K}_{2}=\frac{\mathrm{l}}{\mathrm{~K}_{1}^{2}}
$$

## 6. Writing Equilibrium Constant Expressions

## Problem

Calculate K for the reaction

$$
\mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{CO}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{CO}_{2}(\mathrm{~g})
$$

given that:

$$
\begin{aligned}
& \mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \quad \mathrm{K}=8.12 \\
& \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{CO}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \quad \mathrm{K}=0.771
\end{aligned}
$$

## Solution

In general, when two or more equations are added to produce a net equation, the equilibrium constant for the net equation is the product of the equilibrium constants for the added equations. In this case, we need to reverse and double the second reaction to add to the first reaction.

$$
\begin{array}{cl}
\mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & \mathrm{K}=8.12 \\
2 \mathrm{CO}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightleftarrows 2 \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{CO}_{2}(\mathrm{~g}) & \mathrm{K}=\frac{1}{(0.771)^{2}} \\
\hline \mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{CO}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{CO}_{2}(\mathrm{~g}) & \mathrm{K}=(8.12)\left(\frac{1}{(0.771)^{2}}\right)
\end{array}
$$

For this reaction, $K=13.7$

## 7. Evaluation of the Value of $K$

## Question

The equilibrium constant for the formation of gaseous lithium iodide by combination of the elements in the gas phase at 3000 K is given as:

$$
\mathrm{Li}(\mathrm{~g})+{ }^{1} / 2 \mathrm{I}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{LiI}(\mathrm{~g}) \quad \mathrm{K}_{\mathrm{p}}=644
$$

(a) What is the equilibrium constant value for this reaction if it is represented by the equation given above multiplied by a factor of 2 ?
(b) What is the equilibrium constant value for the reverse of the reaction as written above?

## Solution

(a) Multiplying the reaction by a factor of 2 requires that the given value of $K_{p}$ be squared:

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{p}}=(644)^{2}=4.15 \times 10^{5} \\
& 2 \mathrm{Li}(\mathrm{~g})+{ }^{1} / 2 \mathrm{I}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{LiI}(\mathrm{~g}) \quad \mathrm{K}_{\mathrm{p}}=(644)^{2}
\end{aligned}
$$

(b) When the equation is reversed, $\mathrm{K}_{\mathrm{p}}$ becomes the reciprocal of the original value:

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{p}}=\frac{1}{644}=1.55 \times 10^{-3} \\
& \mathrm{~K}_{\mathrm{p}}=\frac{1}{644}
\end{aligned}
$$

## 8. Reaction Quotient

## Problem

The concentration equilibrium constant $\left(\mathrm{K}_{\mathrm{c}}\right)$ for the reaction

$$
\mathrm{ClF}_{3}(\mathrm{~g}) \rightleftarrows \mathrm{ClF}(\mathrm{~g})+\mathrm{F}_{2}(\mathrm{~g})
$$

is $8.77 \times 10^{-14}$ at $25^{\circ} \mathrm{C}$. Describe what happens quantitatively when a solution is prepared so that it is 17.50 M in $\mathrm{ClF}_{3}, 1.3 \times 10^{-6} \mathrm{M}$ in ClF, and $4.72 \times 10^{-7} \mathrm{M}$ in $\mathrm{F}_{2}$.

## Approach

Calculate the reaction quotient, Q , and compare it to K .

## Solution

The reaction quotient for the solution is:

$$
\mathrm{Q}=\frac{\left.\left[\mathrm{ClFP}^{2}\right] \mathrm{F}_{2}\right]}{\left[\mathrm{ClF}_{3}\right]}=\left(1.3 \times 10^{-6} \mathrm{M}\right) \frac{\left(4.72 \times 10^{-7} \mathrm{M}\right)}{(17.50 \mathrm{M})}=3.5 \times 10^{-14}
$$

$\mathrm{Q}<\mathrm{K}_{\mathrm{c}}$, therefore the concentrations of the reactants will decrease and those of the products will increase, and the reaction will proceed toward equilibrium in the forward direction. In this case, $\mathrm{ClF}_{3}$ will decompose until equilibrium is reached.

## 9. Equilibrium Concentrations

## Question

Chlorine gas, $\mathrm{Cl}_{2}$, dissociates into chlorine atoms in a reversible reaction for which $\mathrm{K}=0.37$ at 3000 K . What is the concentration of chlorine atoms in a vessel that originally contained 1.0 M of molecular chlorine?

## Approach

First, write the balanced equation. Then write the corresponding equilibrium expression and identify what is unknown. Make a table to include the chemical equation, initial concentrations, changes in concentration, and equilibrium concentrations. Substitute the equilibrium concentrations from the table into the equilibrium expression and solve for the unknown (x). If an approximation was made, remember to check for validity. Finally, answer the question in the problem using some form of the value of x .

## Solution

The reaction is $\mathrm{Cl}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{Cl}(\mathrm{g})$. The unknown is $[\mathrm{Cl}]$ at equilibrium, and we choose the concentration of $\mathrm{Cl}_{2}$ that dissociates into Cl as x . The algebraic expression that must be solved for is found by arranging the known and the unknown as shown in this lesson.

|  | $\mathbf{C l}_{\mathbf{2}}$ | $\rightleftarrows$ | $\mathbf{2 ~ C l}(\mathbf{g})$ |
| :--- | :---: | :---: | :---: |
| Initial | 1.0 M | 0 M |  |
| Change | -x |  | +2 x |
| Equilibrium | $1.0-\mathrm{x}$ | 2 x |  |

The equilibrium constant is represented as:

$$
\mathrm{K}=\frac{\left[\mathrm{Cl}^{2}\right.}{\left[\mathrm{Cl}_{2}\right]}=\frac{(2 \mathrm{x})^{2}}{(1.0-\mathrm{x})}=0.37
$$

Inspection shows that the values of K and the known concentration are similar in magnitude, therefore this problem should be solved using the quadratic equation.

$$
\begin{aligned}
& 4 x^{2}=(0.37)(1.0-x) \\
& 4 x^{2}+0.37 x-0.37=0
\end{aligned}
$$

With $\mathrm{a}=4, \mathrm{~b}=0.37$, and $\mathrm{c}=-0.37$, the quadratic equation is:

$$
\frac{-0.37 \pm \sqrt{(0.37)^{2}-(4)(4)(-0.37)}}{(2)(4)}
$$

$\frac{-0.37 \pm 2.5}{8}$
$\mathrm{x}=0.27 \mathrm{M}$ or -0.36 M
Therefore, $[\mathrm{Cl}]_{2}=2 \mathrm{x}=(2)(0.27 \mathrm{M})=0.54 \mathrm{M}$.
Finally, check this answer by substituting all concentrations into the equilibrium expressions and compare.

$$
\mathrm{K}=\frac{\left\lceil\mathrm{Cl}^{2}\right.}{\left[\mathrm{Cl}_{2}\right]}=\frac{(0.54)^{2}}{(1.0-0.27)}=0.40
$$

## 10. Le Chatelier's Principle: Factors That Influence Equilibria - Concentration

## Problem

A reaction of potassium chromate and hydrochloric acid was allowed to come to equilibrium:

$$
\begin{array}{cc}
2 \mathrm{CrO}_{4}^{2-}+\mathrm{H}^{+} & \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{H}_{2} \mathrm{O}(\ell) \\
\text { chromate ion } & \text { dichromate ion } \\
\text { yellow } & \text { orange }
\end{array}
$$

Describe the changes that will occur in the equilibrium system when:
(a) additional acid is added
(b) additional potassium chromate is added
(c) zinc is added (note that $\mathrm{ZnCrO}_{4}$ is highly insoluble and $\mathrm{ZnCr}_{2} \mathrm{O}_{7}$ is very soluble)
(d) NaOH is added

## Solution

(a) Some of the additional $\mathrm{H}^{+}$will react with the remaining chromate ion to produce more dichromate ion and water. $\left[\mathrm{CrO}_{4}{ }^{2-}\right]$ will decrease and $\left[\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}\right]$ will increase.
(b) Some of the additional chromate ion will react with some of the $\mathrm{H}^{+}$to produce more dichromate ion. Water and $\left[\mathrm{H}^{+}\right]$will decrease.
(c) Addition of $\mathrm{Zn}^{2+}$ will remove some of the chromate ion as $\mathrm{ZnCrO}_{4}$. This will lower the concentration of chromate ion. Thus, some of the dichromate ion will react to form additional chromate ion and $\mathrm{H}^{+}$.
(d) Addition of NaOH will remove some of the $\mathrm{H}^{+}$as a result of an acid-base reaction. The decrease in $\left[\mathrm{H}^{+}\right]$ will yield a reaction of additional $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ with $\mathrm{H}_{2} \mathrm{O} .\left[\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}\right]$ will decrease and $\left[\mathrm{CrO}_{4}{ }^{2-}\right]$ will increase.

## 11. Le Chatelier's Principle: Factors That Influence Equilibria -Temperature and Pressure

## Question

For the reaction
$2 \mathrm{Hg}(\ell)+\mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{HgO}(\mathrm{s})$
$\Delta \mathrm{H}^{\circ}=-180.7 \mathrm{~kJ}$ over a temperature range of 298 K to $500 \mathrm{~K} . \mathrm{K}_{\mathrm{p}}=3.2 \times 10^{20}$ at 298 K .
(a) Is the value of $\mathrm{K}_{\mathrm{p}}$ at 500 K expected to be greater or less than the value of $\mathrm{K}_{\mathrm{p}}$ at 298 K ?
(b) Will a decrease in the partial pressure of $\mathrm{O}_{2}$ cause the reaction to shift to the left or to the right?

## Solution

(a) This is an exothermic reaction, thus heat can be considered a "product."

$$
2 \mathrm{Hg}(\ell)+\mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{HgO}(\mathrm{~s})+180.7 \mathrm{~kJ}
$$

Increasing the temperature favors the endothermic reaction, or the reverse reaction in this case. Therefore, the equilibrium will be shifted toward the reactant side (left) as the temperature is increased. The value of $\mathrm{K}_{\mathrm{p}}$ is expected to be less than $3.2 \times 10^{20}$. (The value of $\mathrm{K}_{\mathrm{p}}$ at 500 K is $5.1 \times 10^{-7}$.)
(b) Decreasing the pressure favors an increase in the amount of gas present. In this case, the reverse reaction (shift to the left) would be favored.

## 12. Le Chatelier's Principle: Factors That Influence Equilibria - Concentration, Temperature, and Volume

Problem The value of $\mathrm{K}_{\mathrm{p}}$ for the following reaction is 0.16 at $25^{\circ} \mathrm{C}$. The enthalpy change for the reaction at standard conditions is +16.1 kJ .
$2 \mathrm{NOBr}(\mathrm{g}) \rightleftarrows 2 \mathrm{NO}(\mathrm{g})+\mathrm{Br}_{2}(\mathrm{~g})$
To which direction will the equilibrium shift (left, right, or no change) and how will K change when each of the following changes to the system is made?
(a) Adding more $\mathrm{Br}_{2}(\mathrm{~g})$
(b) Removing some $\operatorname{NOBr}(\mathrm{g})$
(c) Decreasing the temperature
(d) Increasing the container volume

## Approach

This is an endothermic reaction, thus heat is considered a "reactant."

$$
+16.1 \mathrm{~kJ}+2 \mathrm{NOBr}(\mathrm{~g}) \rightleftarrows 2 \mathrm{NO}(\mathrm{~g})+\mathrm{Br}_{2}(\mathrm{~g})
$$

## Solution

(a) Left. Some of the added "product" will be consumed, thus the equilibrium will shift to the left. There will be no change in $K$.
(b) Left. Here, a "reactant" is being depleted. The equilibrium will shift to the left. K will not change.
(c) Left. When the temperature decreases, the system responds by shifting in the direction that leads to generation of thermal energy. The equilibrium shifts left and the value of K decreases.
(d) Right. Increasing the volume of the flask will result in a shift to the side of the equilibrium with more gas molecules. There are three moles of gas on the right and only two on the left. K will not change.

## CH 223 Chapter Fourteen Part I Concept Guide

## 1. Identifying Brønsted-Lowry Acids and Bases

## Problem

Identify the Brønsted-Lowry acid (a reactant) and its conjugate base (a product) in each of the following reactions:
(a) $\mathrm{HNO}_{3}(\ell)+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{NO}_{3}^{-}$
(b) $\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{HS}^{-} \rightleftarrows \mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)$
(c) $\mathrm{HF}(\mathrm{aq})+\mathrm{OH}^{-} \rightleftarrows \mathrm{H}_{2} \mathrm{O}(\ell)+\mathrm{F}^{-}$

## Solution

The Brønsted-Lowry acids are the species that donates the proton in each reaction. In the above reactions, the Brønsted-Lowry acids are:
(a) $\mathrm{HNO}_{3}$
(b) $\mathrm{H}_{3} \mathrm{O}^{+}$
(c) HF

The conjugate base for each acid is the species formed by the removal of a proton from the acid:
(a) $\mathrm{NO}_{3}^{-}$
(b) $\mathrm{H}_{2} \mathrm{O}$
(c) $\mathrm{F}^{-}$

## 2. Ion Product Constant of Water

## Question

What is the concentration of $\mathrm{OH}^{-}$in a 0.04 M HCl solution?

## Approach

Because HCl is a strong acid and is $100 \%$ ionized, the $\mathrm{H}_{3} \mathrm{O}^{+}$concentration is equivalent to the molarity of the HCl solution, 0.04 M . To solve this problem, use the relationship between the concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{OH}^{-}$ and water: $\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]$.

## Solution

$\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]$
Solving this for $\mathrm{OH}^{-}$and substituting the known values of $\mathrm{K}_{\mathrm{w}}$ and $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$gives
$\left[\mathrm{OH}^{-}\right]=\frac{\mathrm{K}_{\mathrm{0}}}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}=\frac{1.00 \times 10^{-14}}{0.04}=3 \times 10^{-13} \mathrm{M}$

## 3. pH and pOH

## Question

What are the pH and $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$of a solution that has $\left[\mathrm{OH}^{-}\right]=2.50 \times 10^{-5} \mathrm{M}$ ?

## Solution

$\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(2.50 \times 10^{-5} \mathrm{M}\right)=4.60$
$\mathrm{pH}=14.00-\mathrm{pOH}=14.00-4.60=9.40$
$\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\mathrm{pH}=-9.40$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=3.98 \times 10^{-10}$

## 4. $\mathrm{K}_{\mathrm{a}}-\mathrm{K}_{\mathrm{b}}$ Relationship

## Problem

The value of $\mathrm{K}_{\mathrm{a}}$ for hydrocyanic acid (HCN) is $6.2 \times 10^{-10}$. Calculate the value of $\mathrm{K}_{\mathrm{b}}$ for the conjugate base.

## Solution

$\mathrm{HCN}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{CN}^{-}$
In this reaction, the conjugate base is the cyanide ion, $\mathrm{CN}^{-}$. The value of $\mathrm{K}_{\mathrm{b}}$ for the reaction of $\mathrm{CN}^{-}$as a base with water is:
$\mathrm{CN}^{-}+\mathrm{H}_{2} \mathrm{O}(\ell) \longrightarrow \mathrm{HCN}(\mathrm{aq})+\mathrm{OH}^{-}$
$K_{b}=\frac{K_{0 j}}{K_{a}}=\frac{1.00 \times 10^{-14}}{6.2 \times 10^{-10}}=1.6 \times 10^{-5}$
The value of $\mathrm{K}_{\mathrm{b}}$ for the conjugate base, $\mathrm{CN}^{-}$, is $1.6 \times 10^{-5}$.

## 5. Calculating pH

## Question

If the hydronium ion concentration in vinegar is $1.8 \times 10^{-3}$, what is its pH ?

## Solution

$$
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log \left(1.8 \times 10^{-3}\right)=2.74
$$

## 6. Calculating pH

## Problem

Find the pH of a 0.052 M hypobromous acid ( HBrO ) solution.

$$
\mathrm{HBrO}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{BrO}^{-} \quad \mathrm{K}_{\mathrm{a}}=2.2 \times 10^{-9}
$$

## Approach

Write the corresponding equilibrium expression and identify what is unknown. Make a table to include the chemical equation, initial concentrations, changes in concentration, and equilibrium concentrations. Substitute the equilibrium concentrations from the table into the equilibrium expression and solve for the unknown (x). If an approximation was made, remember to check for validity. Finally, answer the question in the problem using some form of the value of $x$.

## Solution

The unknown is $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$at equilibrium. Letting $\mathrm{x}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$,

|  | $\mathbf{H B r O}(\mathbf{a q}) \rightleftarrows$ | $\mathbf{H}_{3} \mathbf{O}^{+}$ | $\mathbf{+} \mathbf{B r O}^{-}$ |
| :--- | :--- | :--- | :--- |
| Initial | 0.052 M | 0 M | 0 M |
| Change | -x | +x | +x |
| Equilibrium | $0.052-\mathrm{x}$ | x | x |

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{BrO}^{-}\right]}{[\mathrm{HBrO}]}=\frac{(\mathrm{x})(\mathrm{x})}{(0.052-\mathrm{x})}=2.2 \times 10^{-9} \\
& \text { If } \frac{\mathrm{K}_{\mathrm{a}}[\text { initial }]}{1000} \text {, then } \mathrm{K}_{\mathrm{a}}=\frac{\mathrm{x}^{2}}{[\text { initial }]-\mathrm{x}} \cong \frac{\mathrm{x}^{2}}{\text { [initial }]}
\end{aligned}
$$

Assuming that $(0.052-\mathrm{x})$ is approximately equal to 0.052 ,

$$
\begin{aligned}
& \mathrm{x}^{2}=(0.052)\left(2.2 \times 10^{-9}\right)=1.1 \times 10^{-10} \mathrm{M} \\
& \mathrm{x}=1.1 \times 10^{-5} \mathrm{M} \\
& \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\log \left(1.1 \times 10^{-5}\right)=4.95
\end{aligned}
$$

The pH of this solution is 4.95 .

## 7. Predicting the pH of Salt Solutions

## Problem

Predict whether each salt listed below has a pH greater then, less than, or equal to 7 .
(a) $\mathrm{FeCl}_{3}$
(b) $\mathrm{NH}_{4} \mathrm{NO}_{3}$
(c) $\mathrm{Na}_{2} \mathrm{HPO}_{4}$

## Solution

(a) $\mathrm{Fe}^{3+}$ ion is acidic and $\mathrm{Cl}^{-}$ion is neutral. Therefore $\mathrm{FeCl}_{3}$ is acidic, and the pH is less than 7 .
(b) $\mathrm{NH}_{4}{ }^{+}$is acidic and $\mathrm{NO}_{3}{ }^{-}$is neutral. Therefore, $\mathrm{NH}_{4} \mathrm{NO}_{3}$ is acidic, and the pH is less than 7 .
(c) $\mathrm{Na}^{+}$is neutral and $\mathrm{HPO}_{4}^{2-}$ is basic. Therefore, $\mathrm{Na}_{2} \mathrm{HPO}_{4}$ is basic, and the pH is greater than 7 .

## 8. Identifying Lewis Bases

## Problem

Each of the following is a Lewis acid-base reaction:
(a) $\mathrm{Ni}^{2+}(\mathrm{aq})+4 \mathrm{CN}^{-}(\mathrm{aq}) \rightarrow \mathrm{Ni}(\mathrm{CN})_{4}{ }^{2-}(\mathrm{aq})$
(b) $\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}^{+} \rightarrow \mathrm{NH}_{4}^{+}$
(c) $\mathrm{BF}_{3}(\mathrm{aq})+\mathrm{F}^{-} \rightarrow \mathrm{BF}_{4}^{-}$
(d) $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}(\Omega)$

## Solution

(a) $\mathrm{CN}^{-}$is the base. An electron pair is donated by the carbon atom to the nickel ion.
(b) In Lewis acid-base terms, the free hydrogen ion is thought of as the electron-pair acceptor. Here, $\mathrm{NH}_{3}$ is the base and the electron-pair donor.
(c) The fluoride ion donates a pair of electrons to the boron atom and is therefore the base.
(d) $\mathrm{The}^{+}{ }^{+}$ion is an electron-pair acceptor, a Lewis acid. The $\mathrm{OH}^{-}$ion is an electron-pair donor, a Lewis base. This shows that water-ion acids and bases are also Lewis acids and bases.

## 9. Lewis Acids and Bases

## Problem

Determine whether each substance below should be classified as a Lewis acid or base.
(a) $\mathrm{Mn}^{2+}$
(b) $\mathrm{CH}_{3} \mathrm{NH}_{2}$
(c) $\mathrm{H}_{2} \mathrm{NOH}$ in the reaction: $\mathrm{H}_{2} \mathrm{NOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightarrow\left[\mathrm{H}_{3} \mathrm{NOH}\right] \mathrm{Cl}(\mathrm{aq})$
(d) $\mathrm{SO}_{2}$ in the reaction: $\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{BF}_{3}(\mathrm{~g}) \rightarrow \mathrm{O}_{2} \mathrm{~S}_{-\mathrm{BF}_{3}(\mathrm{~s})}$

## Solution

(a) Lewis acid. $\mathrm{Mn}^{2+}$ is expected to accept an electron pair because it is positively charged.
(b) Lewis base. $\mathrm{CH}_{3} \mathrm{NH}_{2}$ is anticipated to donate an electron pair. The N atom has a long electron pair with which it can form a bond with a Lewis acid.
(c) Lewis base. In the reaction, $\mathrm{H}_{2} \mathrm{NOH}$ donates an electron pair to the $\mathrm{H}^{+}$ion of HCl to form the adduct, $\left[\mathrm{H}_{3} \mathrm{NOH}\right] \mathrm{Cl}$.
(d) Lewis base. $\mathrm{SO}_{2}$ has a lone electron pair on the central S atom. In the reaction, $\mathrm{SO}_{2}$ donates an electron pair to form the adduct, $\mathrm{O}_{2} \mathrm{~S}-\mathrm{BF}_{3}$.

## 10. Classifying Lewis Acid-Base Reactions

## Question

Which of the following reactions are Lewis acid-base reactions? Identify the Lewis base in each of the acidbase reactions.
(a) $\mathrm{Ag}^{+}+2 \mathrm{NH}_{3} \rightarrow\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$
(b) $\mathrm{I}^{-}+\mathrm{I}_{2} \rightarrow \mathrm{I}_{3}^{-}$
(c) $\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}$
(d) $\mathrm{H}^{+}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2}+\mathrm{OH}^{-}$

## Answer

All the above reactions are Lewis acid-base reactions. The Lewis bases, the species that donate an electron pair to form a bond with another species, are:
(a) $\mathrm{NH}_{3}$
(b) $\mathrm{I}^{-}$
(c) $\mathrm{OH}^{-}$
(d) $\mathrm{H}_{2} \mathrm{O}$

## CH 223 Chapter Fourteen Part II Concept Guide

## 1. Common Ion Effect

## Question

What is the pH of a solution that is $0.10 \mathrm{~mol} / \mathrm{L}$ in $\mathrm{NH}_{3}$ and $0.10 \mathrm{~mol} / \mathrm{L}$ in $\mathrm{NH}_{4} \mathrm{NO}_{3}$ ?
$\mathrm{K}_{\mathrm{b}}=1.8 \times 10^{-5}$ for $\mathrm{NH}_{3}$ at $23{ }^{\circ} \mathrm{C}$.

$$
\left.\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)\right) \rightleftarrows \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}
$$

## Solution

The ammonia-water equilibrium controls the pH .

$$
\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}
$$

Let $\mathrm{x}=\mathrm{OH}^{-}$. The ammonium ion concentration at equilibrium is the addition of the amount formed by the above reaction to the amount added as ammonium nitrate. The ammonium nitrate is soluble and a strong electrolyte, thus adding to the total ammonium ion concentration.

|  | $\mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows$ | $\mathrm{NH}_{4}{ }^{+}+$ | $\mathrm{OH}^{-}$ |
| :---: | :---: | :---: | :---: |
| Initial | 0.10 | 0.10 | 0 |
| Change | -x | +x | +x |
| Equilibrium | $0.10-\mathrm{x}$ | $0.10+\mathrm{x}$ | x |

Substituting these values into the equilibrium constant expression:

$$
\mathrm{K}_{\mathrm{b}}=\frac{(0.10+\mathrm{x})(\mathrm{x})}{(0.10-\mathrm{x})}=1.8 \times 10^{-5}
$$

Assuming that x is small relative to the initial $\mathrm{NH}_{3}$ and $\mathrm{NH}_{4}{ }^{+}$concentrations, this equation becomes

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{b}}=\frac{(0.10)(\mathrm{x})}{(0.10)}=1.8 \times 10^{-5} \\
& \mathrm{OH}^{-}=\mathrm{x}=1.8 \times 10^{-5} \mathrm{~mol} / \mathrm{L}
\end{aligned}
$$

The approximation is valid. The pH and pOH of the solution can be calculated by:

$$
\begin{aligned}
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(1.8 \times 10^{-5}\right)=4.74 \\
& \mathrm{pH}=14.00-\mathrm{pOH}=14.00-4.74=9.26
\end{aligned}
$$

The pH of the solution is 9.26 , indicating that it is an alkaline solution. For comparison, the pH of a $0.1 \mathrm{~mol} / \mathrm{L}$ solution of $\mathrm{NH}_{3}$ is 11.1 , thus the alkalinity of the solution has decreased due to the addition of the $\mathrm{NH}_{4}{ }^{+}$ion.

## 2. Calculate $\mathbf{p K} \mathrm{K}_{\mathrm{a}}$ from $\mathrm{K}_{\mathrm{a}}$

## Problem

Calculate $\mathrm{pK}_{\mathrm{a}}$ for the following acids:
(a) $\mathrm{HSO}_{4}^{-}, \mathrm{K}_{\mathrm{a}}=1.2 \times 10^{-2}$
(b) $\mathrm{HCN}, \mathrm{K}_{\mathrm{a}}=4.0 \times 10^{-10}$
(c) phenol, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}, \mathrm{K}_{\mathrm{a}}=1.3 \times 10^{-10}$

## Approach

$$
\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}
$$

## Solution

(a) $\mathrm{HSO}_{4}^{-}: \mathrm{pK}_{\mathrm{a}}=-\log \left(1.2 \times 10^{-2}\right)=1.92$
(b) HCN: $\mathrm{pK}_{\mathrm{a}}=-\log \left(4.0 \times 10^{-10}\right)=9.40$
(c) phenol, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}: \mathrm{pK}_{\mathrm{a}}=-\log \left(1.3 \times 10^{-10}\right)=9.89$

## 3. Using the Henderson-Hasselbalch Equation

## Question

If 3.00 g of benzoic acid $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}\right)$ and 2.00 g of sodium benzoate $\left(\mathrm{NaC}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}\right)$ are dissolved in enough water to make 1.50 L of solution, what is the pH of this solution? $\mathrm{K}_{\mathrm{a}}=6.3 \times 10^{-5}$ for benzoic acid.

## Approach

First, calculate the $\mathrm{pK}_{\mathrm{a}}$ of the acid. Then, calculate the concentrations of the benzoic acid and its conjugate base, benzoate ion. Finally, find the pH of the solution using the Henderson-Hasselbalch equation:

$$
\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\text { [conjugate base] }}{\text { [acid] }]}
$$

## Solution

The $\mathrm{pK}_{\mathrm{a}}$ of sodium benzoate is:

$$
\mathrm{pK}_{\mathrm{a}}=-\log \left(6.3 \times 10^{-5}\right)=4.20
$$

The concentrations of benzoic acid and benzoate ion from sodium benzoate are:
3.00 g benzoic acid $\left(\frac{1 \mathrm{~mol}}{122.1 \mathrm{~g}}\right)=0.0245 \mathrm{~mol}$ benzoic acid
2.00 g sodium benzoate $\left(\frac{1 \mathrm{~mol}}{144.1 \mathrm{~g}}\right)=0.0139 \mathrm{~mol}$ sodium benzoate

The solution is 1.50 L in volume, therefore the concentration of benzoic acid is:

$$
\frac{0.0245 \mathrm{~mol}}{1.50 \mathrm{~L}}=0.0164 \mathrm{~mol} / \mathrm{L}
$$

Similarly, the concentration of sodium benzoate is $0.00927 \mathrm{~mol} / \mathrm{L}$. Using the Henderson-Hasselbalch equation, the pH is calculated by:

$$
\begin{aligned}
& \mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{[\text { conjugate base }]}{\text { [acid] }} \\
& \mathrm{pH}=4.20+\log \frac{0.00927}{0.0164}=3.95
\end{aligned}
$$

The pH of the solution is 3.95 , which is lower than the $\mathrm{pK}_{\mathrm{a}}$ because the ratio of sodium benzoate to benzoic acid was less than 1 .

## 4. Common Ion Effect: Preparing Buffers

## Question

$\left[\mathrm{CHO}_{2}{ }^{-}\right]$
$\left[\mathrm{CHO}_{2} \mathrm{H}\right]$
What ratio of is needed to make a sodium formate-formic acid buffer solution having a pH of 4.80 ? $\mathrm{K}_{\mathrm{a}}=1.77 \times 10^{-4}$ for formic acid, $\mathrm{CHO}_{2} \mathrm{H}$.

$$
\mathrm{CHO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\Omega) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{CHO}_{2}^{-}
$$

## Solution

A pH of 4.80 corresponds to $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.58 \times 10^{-5} \mathrm{~mol} / \mathrm{L}$. The ratio of acid to common ion in a buffer is given as:

$$
\begin{aligned}
& {\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{\left[\mathrm{CHO}_{2} \mathrm{H}\right]}{\left[\mathrm{CHO}_{2}-\right]} \times 1.77 \times 10^{-4}=1.58 \times 10^{-5} \mathrm{~mol} / \mathrm{L}} \\
& \frac{\left[\mathrm{CHO}_{2}^{-}\right]}{\left[\mathrm{CHO}_{2} \mathrm{H}\right]}=\frac{1.77 \times 10^{-4}}{1.58 \times 10^{-5}}=11.2
\end{aligned}
$$

Therefore, the $\left[\mathrm{CHO}_{2}^{-}\right] /\left[\mathrm{CHO}_{2} \mathrm{H}\right]$ ratio must be 11.2 to 1 to attain a solution having a pH of 4.80 with this buffer system. For example, if $1 \mathrm{~mol} / \mathrm{L} \mathrm{CHO}_{2} \mathrm{H}$ is used, the solution must be $11.2 \mathrm{~mol} / \mathrm{L}$ in sodium formate.

## 5. Titration of a Strong Acid by a Strong Base

## Problem

Calculate the pH of a solution in which 10.0 mL of $0.100 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$ is added to 20.0 mL of $0.100 \mathrm{~mol} / \mathrm{L}$ HCl .

## Approach

First, write the reaction for NaOH and HCl . Then, calculate the number of moles of each reactant. To find $\left[\mathrm{H}^{+}\right]$, calculate the number of moles of excess $\mathrm{H}^{+}$, and divide by the total volume of solution. Finally, calculate the pH from $\left[\mathrm{H}^{+}\right]$.

## Solution

These reactants are strong electrolytes, thus this problem is essentially one of stoichiometry. The reaction is:

$$
\mathrm{H}^{+}+\mathrm{OH}^{-} \longrightarrow \mathrm{H}_{2} \mathrm{O}(\ell)
$$

Calculate the number of moles of each reactant by multiplying the volume (in liters) of each solution by its molar concentration.

$$
\begin{aligned}
& \text { Moles } \mathrm{H}^{+}=0.0200 \mathrm{~L} * 0.100 \mathrm{~mol} / \mathrm{L}=0.00200 \mathrm{~mol} \\
& \text { Moles } \mathrm{OH}^{-}=0.0100 \mathrm{~L} * 0.100 \mathrm{~mol} / \mathrm{L}=0.00100 \mathrm{~mol}
\end{aligned}
$$

Since all of the $\mathrm{OH}^{-}$reacts, the excess $\mathrm{H}^{+}=0.00200 \mathrm{~mol}-0.00100 \mathrm{~mol}=0.00100 \mathrm{~mol} \mathrm{H}^{+}$. With this number, we can now calculate the concentration of $\mathrm{H}^{+}$by dividing this amount by the total volume of solution:

$$
\left[\mathrm{H}^{+}\right]=\frac{0.00100 \mathrm{~mol} \mathrm{H}}{}+\frac{1}{0.0200 \mathrm{~L}+0.0100 \mathrm{~L} \text { solution }}=0.0333 \mathrm{~mol} / \mathrm{L} \mathrm{H}^{+}
$$

The pH of the solution is:

$$
\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=-\log (0.0333)=1.48
$$

## 6. Titration of Weak Acid by a Strong Base

## Problem

Calculate the molar concentration of nicotinate ion at the equivalence point when $20 . \mathrm{mL}$ of $0.10 \mathrm{~mol} / \mathrm{L}$ nicotoinic acid, $\mathrm{HC}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}$, is titrated with $0.10 \mathrm{~mol} / \mathrm{L}$ sodium hydroxide, $\mathrm{NaOH} . \mathrm{K}_{\mathrm{a}}=1.4 \times 10^{-5}$ for nicotinic acid.

$$
\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{HC}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}(\mathrm{aq})+\mathrm{OH}^{-}
$$

## Approach

At the equivalence point, equal molar amounts of nicotinic acid and sodium hydroxide react to give a solution of sodium nicotinate. The molar amount of ion equals the initial amount of acid, therefore we can calculate the moles of nicotinate ion. We can then calculate the concentration of nicotinate ion by dividing the number of moles of nicotinate ion by the total solution volume.

## Solution

Assuming the reaction is complete, $20 . \mathrm{mL}$ of $0.10 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$ is needed to react with $20 . \mathrm{mL}$ of $0.10 \mathrm{~mol} / \mathrm{L}$ nicotinic acid. The molar amount of nicotinate ion formed equals the initial amount of nicotinic acid:
Moles of nicotinate ion $=\frac{0.020 \mathrm{~L} \text { solution } \times 0.10 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}{ }^{-}}{1 \mathrm{~L} \text { solution }}=0.0020 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}{ }^{-}$

The total volume of the solution is $40 . \mathrm{mL}$ assuming there is no loss in volume due to mixing. To find the molar concentration of nicotinate ion, divide the molar amount of nicotinate ion by the total solution volume:

$$
\text { Molar concentration of nicotinate ion }=\frac{0.020 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}^{-}}{0.040 \mathrm{~L} \text { solution }}=0.050 \mathrm{~mol} / \mathrm{L}
$$

## 7. Titration of Weak Acid by a Strong Base

## Question

Using the information in question 3 , calculate the pH of the solution at the equivalence point.

## Solution

The $\mathrm{K}_{\mathrm{a}}$ for nicotinic acid is $1.4 \times 10^{-5}$, therefore $\mathrm{K}_{\mathrm{b}}$ for nicotinate ion (the conjugate base) is:

$$
\mathrm{K}_{\mathrm{b}}=\frac{\mathrm{K}_{0 j}}{\mathrm{~K}_{\mathrm{a}}}=\frac{1.0 \times 10^{-14}}{1.4 \times 10^{-5}}=7.1 \times 10^{-10}
$$

Let $\mathrm{x}=\left[\mathrm{OH}^{-}\right]$.

$$
\mathrm{HC}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}(\mathrm{aq})+\mathrm{OH}^{-}(\ell) \rightleftarrows \quad \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O}(\mathrm{aq})
$$

$\begin{array}{llll}\text { Initial } & 0.050 & 0 & 0\end{array}$
Change -x $+x \quad+x$
Equilibrium $0.050-\mathrm{x} \quad \mathrm{x} \quad \mathrm{x}$
Substituting into the equilibrium equation, gives

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{HC}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}{ }^{-}\right]}=\frac{\mathrm{x}^{2}}{0.050-\mathrm{x}} \\
& \text { If } \mathrm{K}_{\mathrm{a}}<\frac{[\text { initial }]}{1000} \text {, then } \mathrm{K}_{\mathrm{a}}=\frac{\mathrm{x}^{2}}{[\text { initial }]} \times \cong \frac{\mathrm{x}^{2}}{[\text { initial }]}
\end{aligned}
$$

Assuming that $(0.050-\mathrm{x})$ is approximately equal to 0.050 ,

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{HC}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}^{-}\right]}=\frac{\mathrm{x}^{2}}{0.050}=7.1 \times 10^{-10} \\
& {[\mathrm{OH}]=\mathrm{x}=6.0 \times 10^{-6}}
\end{aligned}
$$

Note that x is very small compared to 0.050 , so our assumption is valid. $\left[\mathrm{OH}^{-}\right]$is $6.0 \times 10^{-6} \mathrm{~mol} / \mathrm{L}$. The pH can now be calculated:

$$
\mathrm{pH}=14.00-\mathrm{pOH}=14.00-\left(-\log \left[\mathrm{OH}^{-}\right]\right)=14.00+\log \left(6.0 \times 10^{-6}\right)=8.78
$$

The pH of the solution is 8.78 . The solution pH of 8.78 is greater than 7 , meaning it is basic. This is expected because the result of a reaction between a weak acid and a strong base is a weak base, and in this case, nicotinate ion.

## CH 223 Chapter Fifteen Concept Guide

## 1. Solubility Product

## Problem

The solubility of silver iodide, AgI , at $25^{\circ} \mathrm{C}$ is $2.1 \times 10^{-6} \mathrm{~g} / \mathrm{L}$. Calculate the solubility product of this salt from its solubility.

## Approach

First, write the chemical equation, letting x represent the molar solubility. Then, write the equilibrium constant expression. Third, calculate the molar solubility from the solubility of AgI. Last, calculate the solubility product of AgI from the molar solubility calculated earlier.

## Solution

Step 1. The chemical equation is:

$$
\underset{(\mathrm{x})}{\mathrm{AgI}(\mathrm{~s})} \underset{(\mathrm{x})}{\mathrm{Ag}^{+}(\mathrm{aq})}+\underset{(\mathrm{x})}{\mathrm{I}^{-}(\mathrm{aq})}
$$

Step 2. The equilibrium constant expression is:

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{I}^{-}\right]=(\mathrm{x})(\mathrm{x})=\mathrm{x}^{2}
$$

Step 3. Calculate the molar solubility from the solubility of AgI.

$$
x=\left(\frac{2.1 \times 10^{-6} \mathrm{~g} \mathrm{AgI}}{1 \mathrm{~L}}\right)\left(\frac{1 \mathrm{~mol} \mathrm{AgI}}{234.77 \mathrm{~g} \mathrm{AgI}}\right)=8.9 \times 10^{-9} \mathrm{~mol} / \mathrm{L}
$$

Step 4. Calculate the solubility product of AgI from the molar solubility.

$$
\mathrm{K}_{\mathrm{sp}}=\mathrm{x}^{2}=\left(8.9 \times 10^{-9}\right)^{2}=7.9 \times 10^{-17}
$$

## 2. Solubility Product

## Problem

The solubility product of silver sulfate, $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ is $1.5 \times 10^{-5}$ at $25^{\circ} \mathrm{C}$. Calculate the solubility of this salt from its solubility product. Report the solubility in moles per liter and in grams per liter.

## Approach

First, write the chemical equation, letting x represent the molar solubility. Then, write the equilibrium constant expression. Finally, solve the $\mathrm{K}_{\text {sp }}$ expression to find the solubility of $\mathrm{Ag}_{2} \mathrm{SO}_{4}$.

## Solution

Step 1. The chemical equation is:

Step 2. The equilibrium constant expression is:

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{SO}_{4}{ }^{2-}\right]=(2 \mathrm{x})^{2}(\mathrm{x})=4 \mathrm{x}^{3}=1.5 \times 10^{-5}
$$

Step 3. Solve the $\mathrm{K}_{\mathrm{sp}}$ expression to find the solubility of $\mathrm{Ag}_{2} \mathrm{SO}_{4}$.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{SO}_{4}{ }^{2-}\right]=(2 \mathrm{x})^{2}(\mathrm{x})=4 \mathrm{x}^{3}=1.5 \times 10^{-5}
$$

$$
\mathrm{x}=0.016 \mathrm{~mol} / \mathrm{L} \text { or } 5.0 \mathrm{~g} / \mathrm{L}
$$

## 3. Solubility Product

## Problem

The solubility product of $\mathrm{AlPO}_{4}$ is $5.8 \times 10^{-19}$ at $25^{\circ} \mathrm{C}$. Calculate the solubility of this salt from its solubility product in moles per liter.

## Approach

First, write the chemical equation, letting x represent the molar solubility. Then, write the equilibrium constant expression. Finally, solve the $\mathrm{K}_{\mathrm{sp}}$ expression to find the solubility of $\mathrm{AlPO}_{4}$.

## Solution

Step 1. The chemical equation is:

Step 2. The equilibrium constant expression is:

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Al}^{3+}\right]\left[\mathrm{PO}_{4}^{3-}\right]=(\mathrm{x})(\mathrm{x})=\mathrm{x}^{2}=5.8 \times 10^{-19}
$$

Step 3. Solve the $\mathrm{K}_{\mathrm{sp}}$ expression to find the solubility of $\mathrm{AlPO}_{4}$.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{3+}\right]\left[\mathrm{PO}_{4}^{3-}\right]=(\mathrm{x})(\mathrm{x})=\mathrm{x}^{2}=5.8 \times 10^{-19}
$$

## 4. Ranking Solubilities

## Question

Given the following information, which has a greater solubility: CuBr or CuCl ?
$\mathrm{CuBr} \quad \mathrm{K}_{\text {sp }}$ at $25^{\circ} \mathrm{C}=5.2 \times 10^{-9}$
$\mathrm{CuCl} \quad \mathrm{K}_{\text {sp }}$ at $25^{\circ} \mathrm{C}=1.2 \times 10^{-6}$

## Solution

The stoichiometries for these two salts are the same: $1: 1$. Thus, we can compare their $K_{\text {sp }}$ values to determine which salt is more soluble. The larger the value of $\mathrm{K}_{\text {sp }}$, the more soluble the salt. CuCl has, therefore, a greater solubility than CuBr .

## 5. Precipitation Reactions

## Question

The concentration of chromate ion in an aqueous solution is $0.012 \mathrm{~mol} / \mathrm{L}$.
(a) Will the precipitation of silver chromate take place if a concentration of silver ion of $1 \times 10^{-6} \mathrm{~mol} / \mathrm{L}$ is introduced by adding solid silver nitrate to the solution?
(b) If the answer to (a) is "no," what concentration of silver ion would be necessary to begin precipitation? The $\mathrm{K}_{\text {sp }}$ value of $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ is $2.5 \times 10^{-12}$.

$$
\mathrm{Ag}_{2} \mathrm{CrO}_{4}(\mathrm{~s}) \quad 2 \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq})
$$

## Solution

(a) The ion product for the reaction of $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ is:

$$
\begin{aligned}
& \mathrm{Q}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}{ }^{2-}\right]=\left(1 \times 10^{-6} \mathrm{~mol} / \mathrm{L}\right)^{2}(0.012 \mathrm{~mol} / \mathrm{L})=1 \times 10^{-14} \\
& \mathrm{Q}<\mathrm{K}_{\text {sp }}
\end{aligned}
$$

Because Q is less than $\mathrm{K}_{\text {sp }}$, the forward reaction is favored and no precipitate forms.
(b) Precipitation will begin when $\mathrm{Q}=\mathrm{K}_{\mathrm{sp}}$. The $\left[\mathrm{Ag}^{+}\right]$at which this occurs is calculated by substituting $\left[\mathrm{CrO}_{4}{ }^{2-}\right]=$ $0.012 \mathrm{~mol} / \mathrm{L}$ into the $\mathrm{K}_{\mathrm{sp}}$ expression and solving for $\left[\mathrm{Ag}^{+}\right]$.

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}^{2-}\right]=2.5 \times 10^{-12} \\
& \mathrm{~K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}[0.012 \mathrm{~mol} / \mathrm{L}]=2.5 \times 10^{-12} \\
& {\left[\mathrm{Ag}^{+}\right]=1.4 \times 10^{-5} \mathrm{~mol} / \mathrm{L}}
\end{aligned}
$$

For precipitation of silver chromate to begin, $\left[\mathrm{Ag}^{+}\right]$must be $1.4 \times 10^{-5} \mathrm{~mol} / \mathrm{L}$.

## 6. Precipitation Reactions

## Question

Will a precipitate of $\mathrm{Mg}(\mathrm{OH})_{2}$ form if $10 . \mathrm{mL}$ of 0.010 M NaOH is added to 1.000 L of $0.015 \mathrm{~mol} / \mathrm{L} \mathrm{MgCl}_{2}$ ? Assume that the volume of resulting solution is 1.015 L . The $\mathrm{K}_{\text {sp }}$ value of $\mathrm{Mg}(\mathrm{OH})_{2}$ is $7.1 \times 10^{-12}$.

## Solution

The concentrations of the ions in the resulting solution are:

The ion product is:

$$
\begin{aligned}
& \mathrm{Q}=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=\left(1.5 \times 10^{-2}\right)\left(9.9 \times 10^{-5}\right)^{2}=1.5 \times 10^{-10} \\
& \mathrm{Q}>\mathrm{K}_{\mathrm{sp}}
\end{aligned}
$$

Because Q is greater than $\mathrm{K}_{\mathrm{sp}}$, a precipitate of $\mathrm{Mg}(\mathrm{OH})_{2}$ will form.

## 7. Common Ion Effect

## Problem

The solubility constant of $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ is $1.5 \times 10^{-5}$. Calculate the solubility of this salt in an aqueous solution that contains $0.25 \mathrm{~mol} / \mathrm{L}$ of $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Is there a common ion effect seen here? Assume that none of the ions reacts appreciably with water for form $\mathrm{H}^{+}$or $\mathrm{OH}^{-}$.

## Approach

First, write the chemical equation, letting x represent the molar solubility. Then, write the equilibrium constant expression to calculate the solubility of the salt in pure water from the solubility product. Then, calculate the molar solubility in $\mathrm{Na}_{2} \mathrm{SO}_{4}$ by solving for x . Last, comment on the calculated molar solubility in $\mathrm{Na}_{2} \mathrm{SO}_{4}$ compared to the solubility of the salt.

## Solution

Step 1. The chemical equation is:

Step 2. The equilibrium constant expression for the salt in pure water is:

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{SO}_{4}{ }^{2-}\right]=(2 \mathrm{x})^{2}(\mathrm{x})=4 \mathrm{x}^{3}=1.5 \times 10^{-5}
$$

Solve the $\mathrm{K}_{\mathrm{sp}}$ expression to find the solubility of $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ in pure water.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{SO}_{4}{ }^{2-}\right]=(2 \mathrm{x})^{2}(\mathrm{x})=4 \mathrm{x}^{3}=1.5 \times 10^{-5}
$$

Step 3. In this example, there are two sources of $\mathrm{SO}_{4}{ }^{2-}$ in the solution: the dissolved $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ and the initial $\mathrm{Na}_{2} \mathrm{SO}_{4}$ in the solution. The equilibrium constant expression becomes:

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{SO}_{4}{ }^{2-}\right]=(2 \mathrm{x})^{2}(0.25+\mathrm{x})=1.5 \times 10^{-5}
$$

Step 4. The $\mathrm{K}_{\mathrm{sp}}$ is small relative to the $0.25 \mathrm{~mol} / \mathrm{L}$ initial $\mathrm{SO}_{4}{ }^{2-}$, therefore, we can assume that $(0.25+\mathrm{x})$ is approximately 0.25 . Solving for x ,

The approximation is valid. The molar solubility is $0.0039 \mathrm{~mol} / \mathrm{L}$, thus the common ion effect has reduced the solubility from $0.016 \mathrm{~mol} / \mathrm{L}$ for $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ in pure water to $0.0039 \mathrm{~mol} / \mathrm{L}$ in the $\mathrm{Na}_{2} \mathrm{SO}_{4}$ solution.

## 8. Solubility and $\mathbf{p H}$

## Question

A 0.015 mol sample of solid $\mathrm{Fe}(\mathrm{OH})_{3}$ was added to 1.0 L of water, and a strong acid was added until the $\mathrm{Fe}(\mathrm{OH})_{3}$ precipitate dissolved. At what pH was all of the $\mathrm{Fe}(\mathrm{OH})_{3}(\mathrm{~s})$ dissolved? Assume negligible volume change due to the addition of the acid. The $\mathrm{K}_{\text {sp }}$ for $\mathrm{Fe}(\mathrm{OH})_{3}$ is $3 \times 10^{-39}$.

$$
\mathrm{Fe}(\mathrm{OH})_{3}(\mathrm{~s}) \quad \mathrm{Fe}^{3+}(\mathrm{aq})+3 \mathrm{OH}^{-}(\mathrm{aq})
$$

## Solution

When all of the $\mathrm{Fe}(\mathrm{OH})_{3}$ dissolved, 0.015 mol of $\mathrm{Fe}^{3+}$ was present in 1.0 L of solution. The concentration of $\mathrm{OH}^{-}$ at the point when dissolution was complete may be found from the solubility product expression for $\mathrm{Fe}(\mathrm{OH})_{3}$.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{OH}^{-}\right]^{3}=3 \times 10^{-39}
$$

To calculate the pH , use the formula for pOH , where $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$. Then, calculate the pH from pOH .

$$
\begin{aligned}
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(6 \times 10^{-13}\right)=12.2 \\
& \mathrm{pH}=14.0-\mathrm{pOH}=14.0-12.2=1.8
\end{aligned}
$$

When all of the solid $\mathrm{Fe}(\mathrm{OH})_{3}$ dissolved, the pH of the solution was 1.8.

## 9. Solubility and $\mathbf{p H}$

## Question

A 0.020 mol sample of solid $\mathrm{Fe}(\mathrm{OH})_{2}$ was added to 1.0 L of water, and a strong acid was added until the $\mathrm{Fe}(\mathrm{OH})_{2}$ precipitate dissolved. At what pH was all of the $\mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{~s})$ dissolved? Assume negligible volume change due to the addition of the acid. The $\mathrm{K}_{\mathrm{sp}}$ for $\mathrm{Fe}(\mathrm{OH})_{2}$ is $8 \times 10^{-16}$.

$$
\mathrm{Fe}(\mathrm{OH})_{2}(\mathrm{~s}) \quad \mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})
$$

## Solution

When all of the $\mathrm{Fe}(\mathrm{OH})_{2}$ dissolved, 0.020 mol of $\mathrm{Fe}^{2+}$ was present in 1.0 L of solution. The concentration of $\mathrm{OH}-$ at the point when dissolution was complete may be found from the solubility product expression for $\mathrm{Fe}(\mathrm{OH})_{2}$.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Fe}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=8 \times 10^{-16}
$$

To calculate the pH , use the formula for pOH , where $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$. Then, calculate the pH from pOH .

$$
\begin{aligned}
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(2 \times 10^{-7}\right)=6.7 \\
& \mathrm{pH}=14.0-\mathrm{pOH}=14.0-6.7=7.3
\end{aligned}
$$

When all of the solid $\mathrm{Fe}(\mathrm{OH})_{2}$ dissolved, the pH of the solution was 7.3.

## 10. Solubility and Complex Ion Formation

## Question

$\mathrm{Zn}(\mathrm{OH})_{2}$ precipitates from an acidic aqueous solution by the addition of $\mathrm{OH}^{-}$ion to $\mathrm{Zn}^{2+}$ ion. There is the danger, however, of redissolving the $\mathrm{Zn}(\mathrm{OH})_{2}$ by addition of too much $\mathrm{OH}^{-}$ion because of the formation of the $\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}$ complex ion.
(a) What is the pH at which the concentration of $\mathrm{Zn}^{2+}$ falls below $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ due to precipitation of $\mathrm{Zn}(\mathrm{OH})_{2}$ ?
(b) What is the pH at which the concentration of $\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}$ increases above $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ ? The pH range between these points is that in which almost all of the $\mathrm{Zn}^{2+}$ is present as a solid. The $\mathrm{K}_{\text {sp }}$ for $\mathrm{Zn}(\mathrm{OH})_{2}$ is 1.2 x $10^{-17}$ and the K of formation $\left(\mathrm{K}_{\mathrm{f}}\right)$ for $\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}$ is $2 \times 10^{20}$.

$$
\mathrm{Zn}(\mathrm{OH})_{2}(\mathrm{~s}) \quad \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq}) \quad \mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Zn}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}
$$

## Solution

(a) The formation of $\mathrm{Zn}(\mathrm{OH})_{2}$ becomes important as the pH increases. The $\mathrm{OH}^{-}$ion concentration in equilibrium when the concentration of $\mathrm{Zn}^{2+}$ is $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ is

$$
\left[\mathrm{OH}^{-}\right]=3 \times 10^{-7} \mathrm{~mol} / \mathrm{L}
$$

To calculate the pH , use the formula for pOH , where $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$. Then, calculate the pH from pOH .

$$
\begin{aligned}
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(3 \times 10^{-7}\right)=6.5 \\
& \mathrm{pH}=14.0-\mathrm{pOH}=14.0-6.5=7.5
\end{aligned}
$$

The pH at which the concentration of $\mathrm{Zn}^{2+}$ falls below $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ due to precipitation of $\mathrm{Zn}(\mathrm{OH})_{2}$ is 7.5 .
(b) The formation of $\mathrm{Zn}(\mathrm{OH})_{2}$ becomes even more important as the pH increases from neutral to alkaline values. The solubility of $\mathrm{Zn}^{2+}$ may be described by the equilibrium between the precipitate and the complex ion.

The $\mathrm{OH}^{-}$ion concentration in equilibrium with the concentration of $\mathrm{Zn}(\mathrm{OH})_{4}{ }^{2-}$ being $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ is

$$
\left[\mathrm{OH}^{-1}\right]^{2}=\frac{\mathrm{Zn}(\mathrm{OH})_{4}{ }^{2-}}{\mathrm{K}_{\mathrm{sp}} \mathrm{~K}_{\mathrm{f}}}=\frac{1 \times 10^{-4}}{\left(1.2 \times 10^{-17}\right)\left(2 \times 10^{20}\right)}=4 \times 10^{-8}
$$

$$
\left[\mathrm{OH}^{-}\right]=2 \times 10^{-4} \mathrm{~mol} / \mathrm{L}
$$

To calculate the pH , use the formula for pOH , where $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$. Then, calculate the pH from pOH .

$$
\begin{aligned}
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(2 \times 10^{-4}\right)=3.7 \\
& \mathrm{pH}=14.0-\mathrm{pOH}=14.0-3.7=10.3
\end{aligned}
$$

The pH at which the concentration of $\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}$ increases above $1 \times 10^{-4} \mathrm{~mol} / \mathrm{L}$ is 10.3 . Therefore, the optimum precipitation of $\mathrm{Zn}^{2+}$ will result by controlling the pH of the solution between 7.5 and 10.3.

## CH 223 Chapter Sixteen Concept Guide

## 1. Enthalpy

## Question

$\Delta \mathrm{H}^{\circ}$ for the following reaction is positive. What does this mean in terms of the relative strengths of the bonds in the reactants and products?

$$
\mathrm{CH}_{3} \mathrm{OH}(\ell)+\mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathrm{CH}_{3} \mathrm{NH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

## Solution

The fact that $\Delta \mathrm{H}^{\circ}$ is positive indicates that the bonds broken in the reactants are stronger than the bonds formed in the products. The reactants are thus more stable than the products, explaining why the reaction requires an input of thermal energy to occur.

## 2. Entropy

## Problem

For each of the following processes, predict whether you would expect entropy to be greater for the reactants or for the products.
(a) $\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~s})$
(b) $\mathrm{KCl}(\mathrm{s}) \rightarrow \mathrm{KCl}(\mathrm{aq})$
(c) $\mathrm{MgCO}_{3}$ (s) + heat $\rightarrow \mathrm{MgO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$

## Solution

(a) For a given compound, molecules in the vapor state have higher entropy because the vapor state is more disorder than is the solid state. The entropy of solid carbon dioxide is, therefore, less than of $\mathrm{CO}_{2}$ vapor.
(b) Solid KCl is a more ordered state than KCl dissolved in water. Thus, the entropy of the dissolved KCl is greater than that of the solid KCl .
(c) One mole of solid $\mathrm{MgCO}_{3}$ yields one mole of solid MgO and one mole of gaseous $\mathrm{CO}_{2}$. As the number of moles increases from the reactant to the product side of the equation, the entropy also increases. This is particularly true when one of the products is a gas. The products, therefore, have a greater entropy than do the reactants.

## 3. Entropy in Physical Changes

## Question

Would you predict an increase or decrease in the entropy for the system that undergoes the change described below?
(a) Making rock candy (crystalline sugar) from a saturated sugar solution. (System $=$ candy + solution)
(b) Putting cream in your coffee $($ System $=$ cream + coffee $)$

## Solution

(a) The crystallization of the sugar would involve a decrease in entropy. The molecules are more ordered in a crystal than in a solution.
(b) Mixing the cream and the coffee would cause entropy to increase. The randomness of the combined liquids is greater than that of the liquids in separate containers.

## 4. Entropy in Physical Changes

## Question

Calculate the standard state entropy change for the vaporization of one mole of argon at the normal boiling point. $\Delta \mathrm{H}^{\circ}$ is $6519 \mathrm{~J} / \mathrm{mol}$ for argon at 87.5 K . Is this an increase or decrease in entropy?

## Solution

The entropy change for this change of state is

$$
\Delta \mathrm{S}^{\circ}(87.5)(\text { vaporization })=\frac{\Delta \mathrm{H}^{*}(87.5)(\text { vaporization })}{\mathrm{T}}
$$

$\Delta \mathrm{S}^{\circ}$ is positive, indicating that the entropy of argon has increased by $74.5 \mathrm{~J} /(\mathrm{K} \mathrm{mol})$.

## 5. Entropy in Chemical Reactions

## Problem

Predict whether the entropy change for each of the following reactions will be large and negative, large and positive, or small:
(a) $\mathrm{H}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{HCl}(\mathrm{g})$
(b) $2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g}) \rightarrow 2 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$
(c) $2 \mathrm{ZnS}(\mathrm{s})+3 \mathrm{O}_{2}(\mathrm{~g})+$ heat $\rightarrow 2 \mathrm{ZnO}(\mathrm{s})+2 \mathrm{SO}_{2}(\mathrm{~g})$

## Solution

(a) Two moles of gas react to form two moles of gaseous product. Since the number of moles does not change, we would expect only a small change in randomness for this reaction. (The actual value is $20.07 \mathrm{~J} / \mathrm{K}$.)
(a) Two moles of gas react to form three moles of gaseous product. This net gain of one mole indicates that a large, positive value for $\Delta \mathrm{S}^{\circ}$ is likely. (The actual value is $148.54 \mathrm{~J} / \mathrm{K}$.)
(a) Two moles of a solid react with three moles of gas to produce two moles of a solid and two moles of gas. This is a net loss of one mole of gas, which represents a decrease in randomness. Thus, a large, negative value of $\Delta \mathrm{S}^{\circ}$ is expected. (The actual value is $-147.1 \mathrm{~J} / \mathrm{K}$.)

## 6. $\Delta \mathrm{G}^{\circ}$ of Reaction

## Problem

Calculate $\Delta \mathrm{G}^{\circ}$ for the following reaction and determine if it is spontaneous at $25^{\circ} \mathrm{C}$ under standard state conditions. At this temperature, $\Delta \mathrm{H}^{\circ}=-91.34 \mathrm{~kJ}$ and $\Delta \mathrm{S}^{\circ}=41.5 \mathrm{~J} / \mathrm{K}$ for this reaction.

$$
\mathrm{CCl}_{4}(\ell)+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{HCl}(\mathrm{~g})+\mathrm{CHCl}_{3}(\ell)
$$

## Solution

The value of $\Delta \mathrm{G}^{\circ}$ is

$$
\begin{aligned}
& \Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ} \\
& \Delta G^{\circ}=(-91.34 \mathrm{~kJ})-(298.15)(41.5 \mathrm{~J} / \mathrm{K})\left(\frac{1 \mathrm{~kJ}}{1000 \mathrm{~J}}\right) \\
& \Delta G^{\circ}=-103.7 \mathrm{~kJ}
\end{aligned}
$$

The negative value of $\Delta \mathrm{G}^{\circ}$ indicates that the reaction will be spontaneous at this temperature under standard state conditions.

## 7. $\Delta G^{\circ}$ of Reaction

## Problem

Calculate $\Delta \mathrm{G}^{\circ}$ for the following reaction and determine if it is spontaneous at $25^{\circ} \mathrm{C}$. At this temperature, $\Delta \mathrm{H}^{\circ}=$ -391.9 kJ and $\Delta \mathrm{S}^{\circ}=10.29 \mathrm{~J} / \mathrm{K}$ for this reaction.

$$
\mathrm{O}_{3}(\mathrm{~g})+\mathrm{O}(\mathrm{~g}) \rightarrow 2 \mathrm{O}_{2}(\mathrm{~g})
$$

## Solution

$$
\begin{aligned}
& \Delta G^{\circ}=\Delta H^{\circ}-T \Delta S^{\circ} \\
& \Delta G^{\circ}=(-391.9 \mathrm{~kJ})-(298.15)(10.29 \mathrm{~J} / \mathrm{K})\left(\frac{1 \mathrm{~kJ}}{1000 \mathrm{~J}}\right) \\
& \Delta \mathrm{G}^{\circ}=-395.0 \mathrm{~kJ}
\end{aligned}
$$

The negative value of $\Delta \mathrm{G}^{\circ}$ indicates that the reaction will be spontaneous at this temperature.

## 8. Free Energy and Equilibrium

## Problem

Calculate the equilibrium constant for the reaction shown in problem 1.

$$
\mathrm{CCl}_{4}(\ell)+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{HCl}(\mathrm{~g})+\mathrm{CHCl}_{3}(\ell)
$$

$\Delta \mathrm{G}^{\circ}$ is -103.7 kJ at $25^{\circ} \mathrm{C}$ for this reaction.

## Solution

The following equation shows the relationship between $\Delta G^{\circ}$ and the equilibrium constant, $K$.

$$
\Delta \mathrm{G}^{\circ}=-\mathrm{RT} \ln \mathrm{~K}, \text { where } \mathrm{R}=8.314 \mathrm{~J} /(\mathrm{K} \mathrm{~mol})
$$

$$
\ln \mathrm{K}=-\frac{\Delta G^{\circ}}{\mathrm{RT}}=-\frac{(-103.7 \mathrm{~kJ})\left(\frac{1000 \mathrm{~J}}{1 \mathrm{~kJ}}\right)}{(8.314 \mathrm{~J} / \mathrm{K} \cdot \mathrm{~mol})(298 \mathrm{~K})}=41.86
$$

$$
\mathrm{K}=1.5 \times 10^{18}
$$

Under standard state conditions at $25^{\circ} \mathrm{C}$, this reaction is spontaneous and the products are highly favored over the reactants at equilibrium.

## CH 223 Chapter Seventeen Concept Guide

## 1. Half Reactions

## Question

What are the half reactions for the reduction of iron(III) ion to iron(II) ion by tin(II) ion?
$\mathrm{Sn}^{2+}+2 \mathrm{Fe}^{3+} \rightarrow 2 \mathrm{Fe}^{2+}+\mathrm{Sn}^{4+}$

## Solution

Each iron(III) gains one electron during reduction and each tin(II) ion loses two electrons during oxidation.
Reduction half-reaction: $\mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{e}^{-} \rightarrow \mathrm{Fe}^{2+}(\mathrm{aq})$
Oxidation half-reaction: $\mathrm{Sn}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Sn}^{4+}+2 \mathrm{e}^{-}(\mathrm{aq})$

## 2. Ion-Electron Equations

## Problem

Write the balanced half-reaction equation for the reduction of $\mathrm{NO}_{3}^{-}$to $\mathrm{HNO}_{2}(\mathrm{aq})$ in acidic solution.

## Solution

Nitrate ion is reduced to nitrous acid: $\mathrm{NO}_{3}{ }^{-} \rightarrow \mathrm{HNO}_{2}$
This equation is balanced with respect to the N atoms, but the oxygen atoms are unbalanced. Add one $\mathrm{H}_{2} \mathrm{O}$ molecule to the products side to obtain

$$
\mathrm{NO}_{3}^{-} \rightarrow \mathrm{HNO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

The H atoms are balanced in acidic solution by adding three $\mathrm{H}^{+}$atoms to the reactants side, giving

$$
3 \mathrm{H}^{+}+\mathrm{NO}_{3}^{-} \rightarrow \mathrm{HNO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

The charge is balanced by adding two $\mathrm{e}^{-}$to the reactants side.

$$
3 \mathrm{H}^{+}+\mathrm{NO}_{3}^{-}+2 \mathrm{e}^{-} \rightarrow \mathrm{HNO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

The total charge on the left is zero $[(-1)+(3)(+1)+(2)(-1)=0]$ and the total charge on the right is zero. The equation is balanced.

## 3. Cell Reactions

## Problem

For a particular reaction, the anode, cathode, and overall cell reactions are:

$$
\begin{aligned}
& 2 \mathrm{H}^{+}+2 \mathrm{e}^{-} \rightarrow \mathrm{H}_{2}(\mathrm{~g}) \\
& \mathrm{Mg}(\mathrm{~s}) \rightarrow \mathrm{Mg}^{2+}+2 \mathrm{e}^{-} \\
& \mathrm{Mg}(\mathrm{~s})+2 \mathrm{H}^{+} \rightarrow \mathrm{Mg}^{2+}+\mathrm{H}_{2}(\mathrm{~g})
\end{aligned}
$$

Label each reaction as the anode, cathode, and cell reaction.

## Solution

The anode is the site of an oxidation reaction. The cathode is the site of a reduction reaction. The cell reaction is the result of the anode reaction added to the cathode reaction.

Cathode Reaction: $2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{H}_{2}(\mathrm{~g})$
Anode Reaction: $\mathrm{Mg}(\mathrm{s}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$
Cell Reaction: $\mathrm{Mg}(\mathrm{s})+2 \mathrm{H}^{+} \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$

## 4. Electrochemical Cells

## Question

A galvanic cell is prepared by immersing a strip of magnesium metal into $1 \mathrm{M} \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ and a strip of copper metal into $1 \mathrm{M} \mathrm{CuSO}_{4}$. The two solutions are separated by an unglazed porcelain wall.
(a) Write the anode reaction.
(b) Write the cathode reaction.
(c) Write the net cell reaction.
(d) From which electrode do the electrons flow to the other electrode if a wire is used to connect the two electrodes?
(e) What is the standard voltage of this cell (in Volts)?

## Solution

(a) $\mathrm{Mg}(\mathrm{s}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$
(b) $\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{s})$
(c) $\mathrm{Mg}(\mathrm{s})+\mathrm{Cu}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$
(d) The electrons flow from the magnesium electrode to the copper electrode if a wire connects the two electrodes.
(e) The voltage of this cell is 2.71 and is calculated by adding together the standard reduction potentials for the anode and cathode reaction.

$$
\begin{array}{lr}
\mathrm{Mg}(\mathrm{~s}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} & -(-2.37) \\
\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{~s}) & 0.34 \\
\left.\hline \mathrm{Mg}^{( } \mathrm{s}\right)+\mathrm{Cu}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Mg}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s}) & \text { Cell Voltage }=2.71
\end{array}
$$

## 5. Thermodynamics of Electrochemical Cells

## Question

What is the standard cell potential for an electrochemical cell in which the following spontaneous reaction takes place? $\Delta \mathrm{G}^{\circ}$ for this reaction is -50.61 kJ .

$$
\mathrm{Cl}_{2}(\mathrm{~g})+2 \mathrm{Br}^{-}(\mathrm{aq}) \rightarrow \mathrm{Br}_{2}(\mathrm{aq})+2 \mathrm{Cl}^{-}(\mathrm{aq})
$$

## Solution

To solve for $\mathrm{E}^{\circ}$, we need to use

$$
E^{\circ}=\frac{-\Delta G^{\circ}}{\Delta F}
$$

Before solving for $\mathrm{E}^{\circ}$, we must find the value of $n$, the moles of electrons being transferred, by writing the halfreactions for the reduction of $\mathrm{Cl}_{2}$ and oxidation of $\mathrm{Br}^{-}$.

$$
\begin{aligned}
& \mathrm{Cl}_{2}(g)+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{Cl}^{-}(\mathrm{aq}) \\
& 2 \mathrm{Br}^{-}(\mathrm{aq}) \rightarrow \mathrm{Br}_{2}(\mathrm{aq})+2 \mathrm{e}^{-} \\
& \mathrm{Cl}_{2}(\mathrm{~g})+2 \mathrm{Br}^{-}(\mathrm{aq}) \rightarrow \mathrm{Br}_{2}(\mathrm{aq}) 2 \mathrm{Cl}^{-}(\mathrm{aq})
\end{aligned}
$$

The value of $n$ is 2 .
The cell potential is found by solving for $\mathrm{E}^{\circ}$ and substituting $n=2$ and the known value of $\Delta \mathrm{G}^{\circ}$.

$$
\mathrm{E}^{\circ}=-(-50.61 \mathrm{~kJ}) /(2 \text { mole e e})\left(96.5 \mathrm{~kJ} / \mathrm{V} \mathrm{~mol} \mathrm{e} \mathrm{e}^{-}\right)=0.262 \mathrm{~V}
$$

## 6. Thermodynamics of Electrochemical Cells

## Question

Under standard state conditions, the following reaction is spontaneous, and $\mathrm{E}^{\circ}$ is 0.019 V .

$$
3 \mathrm{Zn}(\mathrm{~s})+2 \mathrm{Cr}^{3+}(\mathrm{aq}) \rightarrow 3 \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{Cr}(\mathrm{~s})
$$

Will this reaction occur spontaneously if $\left[\mathrm{Cr}^{3+}\right]=0.010 \mathrm{~mol} / \mathrm{L}$ and $\left[\mathrm{Zn}^{2+}\right]=5.5 \mathrm{~mol} / \mathrm{L}$ ?

## Solution

We will need to find the value of the reaction quotient and then solve for E .

$$
\begin{aligned}
& Q=\frac{\left[Z n^{2+}\right]^{3}}{\left[\mathrm{Cr}^{3+}\right]^{2}}=\frac{(5.5)^{3}}{(0.010)^{2}}=1.7 \times 10^{6} \\
& E=E^{\circ}-\left(\frac{0.0592}{n}\right)(\log Q)=0.019-\left(\frac{0.0592}{6}\right)\left(\log 1.7 \times 10^{6}\right) \\
& E=-0.042
\end{aligned}
$$

The negative cell potential implies that the reaction will not be spontaneous under these conditions. From Le Chatelier's principle, the reverse reaction would be expected to be favored.

## 7. Using the Faraday Constant

## Question

A current of 1.65 amps is passed through a solution containing silver ions, $\mathrm{Ag}^{+}$, for 10.0 minutes. The process causes silver to be deposited at the cathode. What mass of silver is deposited?

## Solution

Step 1. Calculate the charge (number of coulombs) passed in 10.0 minutes.
Charge $($ Coulombs,$C)=$ current $(\mathrm{amps}) \times$ time $($ seconds $)$

$$
\text { Charge (Coulombs, C) }=(1.65 \mathrm{amps})\left(10.0 \text { minutes) }\left(\frac{60 \text { seconds }}{1 \text { minute }}\right)=990 \mathrm{C}\right.
$$

Step 2. Calculate the number of moles of electrons.

$$
(990 \mathrm{C})\left(\frac{1 \mathrm{~mole} \mathrm{e}^{-}}{9.65 \times 10^{4} \mathrm{C}}\right)=1.03 \times 10^{-2} \mathrm{~mol} \mathrm{e}
$$

Step 3. Calculate the number of moles of silver and then the mass of silver deposited.

$$
\left(1.03 \times 10^{-2} \mathrm{~mol} \mathrm{e} \mathrm{e}^{-}\right)\left(\frac{1 \mathrm{~mol} \mathrm{Ag}}{1 \mathrm{~mole}^{-}}\right)\left(\frac{107.9 \mathrm{~g} \mathrm{Ag}}{1 \mathrm{~mol} \mathrm{Ag}}\right)=1.11 \mathrm{~g} \mathrm{Ag}
$$

## 8. Using the Faraday Constant

## Question

A current of 2.00 amps is passed through a solution of $\mathrm{Ni}\left(\mathrm{NO}_{3}\right)_{2}$ for 2.00 hours. What mass of nickel is deposited at the cathode?

## Solution

Step 1. Calculate the charge (number of coulombs) passed in 2 hours.
Charge $($ Coulombs,$C)=$ current $(\mathrm{amps}) \times$ time $($ seconds $)$
Charge (Coulombs, C$)=(2.00 \mathrm{amps})(2.00$ hours $)\left(\frac{60 \text { minutes }}{1 \text { hour }}\right)\left(\frac{60 \text { seconds }}{1 \text { minute }}\right)=1.44 \times 10^{4} \mathrm{C}$ Charge $=1.44 \times 10^{4} \mathrm{C}$

Step 2. Calculate the number of moles of electrons.

$$
\left(1.44 \times 10^{4} \mathrm{C}\right)\left(\frac{1 \mathrm{~mole}^{-}}{9.65 \times 10^{4} \mathrm{C}}\right)=0.149 \mathrm{~mol} \mathrm{e}^{-}
$$

Step 3. Calculate the number of moles of nickel and then the mass of nickel deposited.

$$
\left(0.149 \mathrm{~mol} \mathrm{e} \mathrm{e}^{-}\right)\left(\frac{1 \mathrm{~mol} \mathrm{Ni}}{2 \mathrm{~mole} \mathrm{e}^{-}}\right)\left(\frac{58.693 \mathrm{~g} \mathrm{Ni}}{1 \mathrm{~mol} \mathrm{Ni}}\right)=4.37 \mathrm{~g} \mathrm{Ni}
$$

## 9. Batteries

## Question

In this lesson, the anode, cathode, and net reactions for dry cell and alkaline batteries are shown. Based on these reactions, what is a possible disadvantage to a dry cell battery compared to alkaline battery?

## Solution

In the dry cell battery, the products of the cathode reaction are gases. If current is drawn from the battery rapidly, the gaseous products cannot be consumed rapidly enough, resulting in a drop in potential. In the alkaline battery, no gases are formed, thus there is no decline in potential under high current loads.

## 10. Batteries

## Problem

In principle, a battery can be made from aluminum metal and chlorine gas. Write a balanced equation for the reaction that occurs in a battery using $\mathrm{Al}^{3+}(\mathrm{aq}) / \mathrm{Al}(\mathrm{s})$ and $\mathrm{Cl}_{2}(\mathrm{~g}) / \mathrm{Cl}^{-}(\mathrm{aq})$ half-reactions, and indicate which halfreaction occurs at the anode and which at the cathode.

## Solution

$$
2 \mathrm{Al}(\mathrm{~s})+3 \mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{Al}^{3+}(\mathrm{aq})+6 \mathrm{Cl}^{-}(\mathrm{aq})
$$

Al is the anode and the $\mathrm{Cl}_{2} / \mathrm{Cl}^{-}$compartment is the cathode.

## 11. Corrosion

## Problem

A $5.0-\mathrm{kg}$ magnesium bar is attached to a buried iron pipe to protect the pipe from corrosion. Explain how the magnesium protects the pipe.

## Solution

$\mathrm{E}^{\circ}$ for magnesium oxidation is $2.37 \mathrm{~V} . \mathrm{E}^{\circ}$ for iron oxidation is only 0.44 V . Magnesium is the better oxidizing agent, and thus protects the iron pipe because the metal oxidizes more readily than iron. It is a sacrificial reductant.

## CH 223 Practice Problem Set \#1

This is a practice problem set and not the actual graded problem set that you will turn in for credit. Answers to each problem can be found at the end of this assignment.

## Covering: Chapter Thirteen and Chapter Guide One

Important Tables and/or Constants: $\mathbf{R}=\mathbf{0 . 0 8 2 0 5 7} \mathrm{L} \mathrm{atm} \mathrm{mol}^{-\mathbf{1}} \mathrm{K}^{-1}, 760 \mathrm{~mm} \mathrm{Hg}=1 \mathbf{~ a t m}$

1. Write equilibrium constant expressions for the following reactions. For gases use either pressures or concentrations.
a. $2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})$
b. $\mathrm{CO}(\mathrm{g})+{ }^{1 / 2} \mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{CO}_{2}(\mathrm{~g})$
c. $\mathrm{C}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{CO}(\mathrm{g})$
d. $\mathrm{NiO}(\mathrm{s})+\mathrm{CO}(\mathrm{g}) \rightleftarrows \mathrm{Ni}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
2. $K=5.6 \times 10^{-12}$ at 500 K for the dissociation of iodine molecules to iodine atoms.

$$
\mathrm{I}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{I}(\mathrm{~g})
$$

A mixture has $\left[I_{2}\right]=0.020 \mathrm{~mol} / \mathrm{L}$ and $[\mathrm{I}]=2.0 \times 10^{-8} \mathrm{~mol} / \mathrm{L}$. Is the reaction at equilibrium (at $500 \mathrm{~K})$ ? If not, which way must the reaction proceed to reach equilibrium?
3. The reaction

$$
\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftarrows \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

was examined at $250{ }^{\circ} \mathrm{C}$. At equilibrium, $\left[\mathrm{PCl}_{5}\right]=4.2 \times 10^{-5} \mathrm{~mol} / \mathrm{L},[\mathrm{PCl} 3]=1.3 \times 10^{-2} \mathrm{~mol} /$ L , and $\left[\mathrm{Cl}_{2}\right]=3.9 \times 10^{-3} \mathrm{~mol} / \mathrm{L}$. Calculate $K$ for the reaction.
4. The value of $K$ for the interconversion of butane and isobutane is 2.5 at $25^{\circ} \mathrm{C}$.

$$
\text { butane }(\mathrm{g}) \rightleftarrows \text { isobutane }(\mathrm{g})
$$

If you place 0.017 mol of butane in a 0.50 L flask at $25^{\circ} \mathrm{C}$ and allow equilibrium to be established, what will be the equilibrium concentrations of the two forms of butane?
5. The equilibrium constant for the dissociation of iodine molecules to iodine atoms

$$
\mathrm{I}_{2}(\mathrm{~g}) \rightleftarrows 2 \mathrm{I}(\mathrm{~g})
$$

is $3.76 \times 10^{-3}$ at 1000 K . Suppose $0.105 \mathrm{~mol}^{2} \mathrm{I}_{2}$ is placed in a 12.3 L flask at 1000 K . What are the concentrations of $\mathrm{I}_{2}$ and I when the system comes to equilibrium?
6. Dinitrogen trioxide decomposes to NO and $\mathrm{NO}_{2}$ in an endothermic process $(\Delta H=40.5 \mathrm{~kJ} /$ mol).

$$
\mathrm{N}_{2} \mathrm{O}_{3}(\mathrm{~g}) \rightleftarrows \mathrm{NO}(\mathrm{~g})+\mathrm{NO}_{2}(\mathrm{~g})
$$

Predict the effect of the following changes on the position of the equilibrium; that is, state which way the equilibrium will shift (left, right, or no change) when each of the following changes is made.
a. adding more $\mathrm{N}_{2} \mathrm{O}_{3}(\mathrm{~g})$
b. adding more $\mathrm{NO}_{2}(\mathrm{~g})$
c. increasing the volume of the reaction flask
d. lowering the temperature
7. Consider the isomerization of butane with an equilibrium constant of $K=2.5$ (see question \#4, above.) The system is originally at equilibrium with [butane] $=1.0 \mathrm{M}$ and [isobutane] $=$ 2.5 M .
a. If $0.50 \mathrm{~mol} / \mathrm{L}$ of isobutane is suddenly added and the system shifts to a new equilibrium position, what is the equilibrium concentration of each gas?
b. If $0.50 \mathrm{~mol} / \mathrm{L}$ of butane is added and the system shifts to a new equilibrium position, what is the equilibrium concentration of each gas?
8. Which of the following correctly relates the equilibrium constants for the two reactions shown?

$$
\begin{array}{ll}
\mathrm{A}+\mathrm{B} \rightleftarrows 2 \mathrm{C} & K_{1} \\
\mathrm{C} \rightleftarrows 1 / 2 \mathrm{~A}+1 / 2 \mathrm{~B} & K_{2}
\end{array}
$$

a. $K_{2}=1 /\left(\mathrm{K}_{1}\right)^{1 / 2}$
b. $K_{2}=1 / \mathrm{K}_{1}$
c. $K_{2}=K_{1}{ }^{2}$
d. $K_{2}=-\mathrm{K}_{1}^{1 / 2}$
9. Calculate $K$ for the reaction

$$
\mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{CO}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{CO}_{2}(\mathrm{~g})
$$

given the following information:

$$
\begin{array}{ll}
\mathrm{SnO}_{2}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{Sn}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & K=8.12 \\
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{CO}(\mathrm{~g}) & K=0.771
\end{array}
$$

10. Ammonium hydrogen sulfide decomposes on heating. $\mathrm{NH}_{4} \mathrm{HS}(\mathrm{s}) \rightleftarrows \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$ If $K_{\mathrm{p}}$ for this reaction is 0.11 at $25{ }^{\circ} \mathrm{C}$ (when the partial pressures are measured in atmospheres), what is the total pressure in the flask at equilibrium?
11. Sulfuryl chloride, $\mathrm{SO}_{2} \mathrm{Cl}_{2}$, is a compound with very irritating vapors; it is used as a reagent in the synthesis of organic compounds. When heated to a sufficiently high temperature it decomposes to $\mathrm{SO}_{2}$ and $\mathrm{Cl}_{2}$.

$$
\mathrm{SO}_{2} \mathrm{Cl}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \quad K=0.045 \text { at } 375^{\circ} \mathrm{C}
$$

a. Suppose 6.70 g of $\mathrm{SO}_{2} \mathrm{Cl}_{2}$ is placed in a 1.00 L flask and then heated to $375^{\circ} \mathrm{C}$. What is the concentration of each of the compounds in the system when equilibrium is achieved? What fraction of $\mathrm{SO}_{2} \mathrm{Cl}_{2}$ has dissociated?
b. What are the concentrations of $\mathrm{SO}_{2} \mathrm{Cl}_{2}, \mathrm{SO}_{2}$, and $\mathrm{Cl}_{2}$ at equilibrium in the 1.00 L flask at $375{ }^{\circ} \mathrm{C}$ if you begin with a mixture of $\mathrm{SO}_{2} \mathrm{Cl}_{2}(6.70 \mathrm{~g})$ and $\mathrm{Cl}_{2}(1.00 \mathrm{~atm})$ ? What fraction of $\mathrm{SO}_{2} \mathrm{Cl}_{2}$ has dissociated?
c. Compare the fractions of $\mathrm{SO}_{2} \mathrm{Cl}_{2}$ in parts (a) and (b). Do they agree with your expectations based on Le Chatelier's principle?
12. Neither $\mathrm{PbCl}_{2}$ nor $\mathrm{PbF}_{2}$ is appreciably soluble in water. If solid $\mathrm{PbCl}_{2}$ and solid $\mathrm{PbF}_{2}$ are placed in equal amounts of water in separate beakers, in which beaker is the concentration of $\mathrm{Pb}^{2+}$ greater? Equilibrium constants for these solids dissolving in water are as follows:

$$
\begin{array}{ll}
\mathrm{PbCl}_{2}(\mathrm{~s}) \rightleftarrows \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{Cl}-(\mathrm{aq}) & K=1.7 \times 10^{-5} \\
\mathrm{PbF}_{2}(\mathrm{~s}) \rightleftarrows \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{~F}^{-}(\mathrm{aq}) & K=3.7 \times 10^{-8}
\end{array}
$$

13. Characterize each of the following as product- or reactant- favored.
a. $\mathrm{CO}(\mathrm{g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{CO}_{2}(\mathrm{~g})$
$K_{\mathrm{p}}=1.2 \times 10^{45}$
b. $\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftarrows \mathrm{H}_{2}(\mathrm{~g})+{ }^{1}{ }_{2} \mathrm{O}_{2}(\mathrm{~g})$
$K_{\mathrm{p}}=9.1 \times 10^{-41}$
c. $\mathrm{CO}(\mathrm{g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightleftarrows \mathrm{COCl}_{2}(\mathrm{~g})$
$K_{\mathrm{p}}=6.5 \times 10^{11}$
14. The reaction of hydrogen and iodine to give hydrogen iodide has an equilibrium constant, $K_{\mathrm{c}}$, of 56 at $435^{\circ} \mathrm{C}$.
a. What is the value of $K_{\mathrm{p}}$ ?
b. Suppose you mix 0.45 mol of $\mathrm{H}_{2}$ and 0.45 mol of $\mathrm{I}_{2}$ in a 10.0 L flask at $435^{\circ} \mathrm{C}$. What is the total pressure of the mixture before and after equilibrium is achieved?
c. What is the partial pressure of each gas at equilibrium?

## Answers to the Practice Problem Set:

1. Answers:
a. $\quad K=\frac{\left[\mathrm{H}_{2} \mathrm{O}\right]^{2}\left[\mathrm{O}_{2}\right]}{\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]^{2}}$

$$
K_{\mathrm{p}}=\frac{P_{\mathrm{H}_{2} \mathrm{O}}^{2} P_{\mathrm{O}_{2}}}{P_{\mathrm{H}_{2} \mathrm{O}_{2}}^{2}}
$$

b. $\quad K=\frac{\left[\mathrm{CO}_{2}\right]}{[\mathrm{CO}]\left[\mathrm{O}_{2}\right]^{1 / 2}}$ $K_{\mathrm{p}}=\frac{P_{\mathrm{CO}_{2}}}{P_{\mathrm{CO}} P^{1 / 2}{ }_{\mathrm{o}_{2}}}$
c. $\quad K=\frac{[\mathrm{CO}]^{2}}{\left[\mathrm{CO}_{2}\right]}$ $K_{\mathrm{p}}=\frac{P_{\mathrm{CO}}^{2}}{P_{\mathrm{CO}_{2}}}$
d. $K=\frac{\left[\mathrm{CO}_{2}\right]}{[\mathrm{CO}]}$
$K_{\mathrm{p}}=\frac{P_{\mathrm{CO}_{2}}}{P_{\mathrm{CO}}}$
2. No, $\mathrm{Q}=2.0 \times 10^{-14}$, and $\mathrm{Q}<\mathrm{K}$, so to the right (more products)
3. $K=1.2$
4. [isobutane] $=0.024 \mathrm{M}$, and [butane] $=0.010 \mathrm{M}$
5. $\left[\mathrm{I}_{2}\right]=0.00614$ and $[\mathrm{I}]=0.00480 \mathrm{M}$
6. a. right b. left c. right d. left
7. a. $[$ butane $]=1.1 \mathrm{M},[$ isobutane $]=2.9 \mathrm{M} ; \quad$ b. $[$ butane $]=1.1 \mathrm{M}$, [isobutane $]=2.9 \mathrm{M}$
8. equation (a)
9. 13.7
10.0 .66 atm
11. a. $\left[\mathrm{SO}_{2} \mathrm{Cl}_{2}\right]=0.020 \mathrm{M},\left[\mathrm{SO}_{2}\right]=\left[\mathrm{Cl}_{2}\right]=0.030 \mathrm{M}$, and fraction $=0.60 \quad$ b. $\left[\mathrm{SO}_{2} \mathrm{Cl}_{2}\right]=0.025$ $\mathrm{M},\left[\mathrm{SO}_{2}\right]=0.025 \mathrm{M},\left[\mathrm{Cl}_{2}\right]=0.044 \mathrm{M}$, and fraction $=0.50 \mathrm{c}$. Yes, Le Chatelier's principle predicts equilibrium moves to the reactant side, confirmed
12. $\mathrm{PbCl}_{2}$
13. a. product favored b. reactant favored c. product favored
14. a. $K_{\mathrm{p}}=56$ b. before: 5.2 atm after: 5.2 atm c. $P_{\mathrm{H} 2}=P_{\mathrm{I} 2}=0.55 \mathrm{~atm}, P_{\mathrm{HI}}=4.1 \mathrm{~atm}$

## CH 223 Practice Problem Set \#2

This is a practice problem set and not the actual graded problem set that you will turn in for credit.
Answers to each problem can be found at the end of this assignment.

## Covering: Chapter Fourteen Part I and Chapter Guide Two

Important Tables and/or Constants: The Table of Acids and Bases for CH 223 which follows problem set \#2, and $K_{w}=\mathbf{1 . 0 0} \times 10-14$ at $25^{\circ} \mathrm{C}$

1. What are the products of each of the following acid-base reactions? Indicate the acid and its conjugate base, and the base and its conjugate acid.
```
a. \(\mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow\)
b. \(\mathrm{HSO}_{4}{ }^{-1}+\mathrm{H}_{2} \mathrm{O} \rightarrow\)
c. \(\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{F}^{-1} \rightarrow\)
```

2. Write balanced equations showing how the hydrogen oxalate ion, $\mathrm{HC}_{2} \mathrm{O}_{4}{ }^{-1}$, can be both a Brønsted acid and a Brønsted base.
3. In each of the following acid-base reactions, identify the Brønsted acid and base on the left and their conjugate partners on the right.
a. $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq}) \rightleftarrows \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NH}^{+}(\mathrm{aq})+\mathrm{CH}_{3} \mathrm{CO}_{2}-(\mathrm{aq})$
b. $\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{aq})+\mathrm{HSO}_{4}-(\mathrm{aq}) \rightleftarrows \mathrm{N}_{2} \mathrm{H}_{5}{ }^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
c. $\left[\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}(\mathrm{aq})+\mathrm{OH}-(\mathrm{aq}) \rightleftarrows\left[\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}\right]^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
4. An aqueous solution has a pH of 3.75 . What is the hydronium ion concentration of the solution? What is the hydroxide ion concentration of the solution? Is it acidic or basic?
5. What is the pH of a 0.0015 M solution of $\mathrm{Ba}(\mathrm{OH})_{2}$ ?
6. Several acids are listed here with their respective equilibrium constants:

$$
\begin{gathered}
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}(\mathrm{aq}) \\
K_{\mathrm{a}}=1.3 \times 10^{-10} \\
\mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \underset{\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{HCO}_{2}^{-1}(\mathrm{aq})}{\rightleftarrows} \\
K_{\mathrm{a}}=1.8 \times 10^{-4} \\
\mathrm{HC}_{2} \mathrm{O}_{4}^{-1}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{O}_{4}-(\mathrm{aq}) \\
K_{\mathrm{a}}=6.4 \times 10^{-5}
\end{gathered}
$$

a. Which is the strongest acid? Which is the weakest acid?
b. Which acid has the weakest conjugate base?
c. Which acid has the strongest conjugate base?
7. Epinephrine hydrochloride has a $\mathrm{p} K_{\mathrm{a}}$ value of 9.53 . What is the value of $K_{\mathrm{a}}$ ?
8. A weak base has $K_{\mathrm{b}}=4.7 \times 10^{-11}$. What is the value of $K_{\mathrm{a}}$ for the conjugate acid?
9. Which is the stronger of the following two acids?
a. acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}, K_{\mathrm{a}}=1.8 \times 10^{-5}$
b. chloroacetic acid, $\mathrm{ClCH}_{2} \mathrm{CO}_{2} \mathrm{H}, \mathrm{p} K_{\mathrm{a}}=2.87$
10. Equal molar quantities of sodium hydroxide and sodium hydrogen phosphate $\left(\mathrm{Na}_{2} \mathrm{HPO}_{4}\right)$ are mixed.
a. Write the balanced, net ionic equation for the acid-base reaction that can, in principle, occur.
b. Does the equilibrium lie to the right or left?
11. A 0.015 M solution of hydrogen cyanate, HOCN , has a pH of 2.67 .
a. What is the hydronium ion concentration in the solution?
b. What is the ionization constant, $K_{\mathrm{a}}$, for the acid?
12. A 0.015 M solution of a base has a pH of 10.09 .
a. What are the hydronium and hydroxide ion concentrations of this solution?
b. What is the value of $K_{\mathrm{b}}$ for this base?
13. Phenol $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}\right)$, commonly called carbolic acid, is a weak organic acid.

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftarrows \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \quad K_{\mathrm{a}}=1.3 \times 10^{-10}
$$

If you dissolve 0.195 g of the acid in enough water to make 125 mL of solution, what is the equilibrium hydronium ion concentration? What is the pH of the solution?
14. Calculate the pH of a 0.12 M aqueous solution of the base aniline, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$ (The $K_{\mathrm{b}}$ for aniline equals $4.0 \times 10^{-10}$ ).

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftarrows \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+1}(\mathrm{aq})+\mathrm{OH}^{-1}(\mathrm{aq})
$$

15. Calculate the hydronium ion concentration and pH in a 0.20 M solution of ammonium chloride, $\mathrm{NH}_{4} \mathrm{Cl}$.
16. Decide whether each of the following substances should be classified as a Lewis acid or a Lewis base.
a. $\mathrm{H}_{2} \mathrm{NOH}$ in the reaction: $\mathrm{H}_{2} \mathrm{NOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightarrow\left[\mathrm{H}_{3} \mathrm{NOH}\right][\mathrm{Cl}](\mathrm{aq})$
b. $\mathrm{Fe}^{2+}(\mathrm{aq})$
c. $\mathrm{CH}_{3} \mathrm{NH}_{2}$
17. Given the following solutions:
a. $0.1 \mathrm{M} \mathrm{NH}_{3}$
b. $0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}$
c. 0.1 M NaCl
d. $0.1 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$
e. $0.1 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$
f. $0.1 \mathrm{M} \mathrm{NaCH}_{3} \mathrm{CO}_{2}$
g. $0.1 \mathrm{M} \mathrm{NH}_{4} \mathrm{CH}_{3} \mathrm{CO}_{2}$
i. Which of the solutions are acidic?
ii. Which of the solutions are basic?
iii. Which of the solutions is most acidic?
18. The equilibrium constant for the reaction of formic acid and sodium hydroxide is $1.8 \times 10^{10}$. Confirm this value.

## Answers to the Practice Problem Set:

1. Answers:
a. $\mathrm{HNO}_{3}+\quad \mathrm{H}_{2} \mathrm{O} \rightarrow \quad \mathrm{H}_{3} \mathrm{O}^{+}+\quad \mathrm{NO}_{3^{-}}$ acid A base B conjugate acid of B conjugate base of A
b. $\mathrm{HSO}_{4}{ }^{-}+\quad \mathrm{H}_{2} \mathrm{O} \rightarrow \quad \mathrm{H}_{3} \mathrm{O}^{+}+\quad \mathrm{SO}_{4}{ }^{2-}$ acid A base B conjugate acid of B conjugate base of A
c. $\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{F}^{-} \rightarrow \mathrm{HF}+\quad \mathrm{H}_{2} \mathrm{O}$ acid A base B conjugate acid of B conjugate base of A
2. Answers:

Brønsted acid: $\mathrm{HC}_{2} \mathrm{O}_{4}^{-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq})$
Brønsted base: $\mathrm{HC}_{2} \mathrm{O}_{4}^{-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
3. Answers:

Brønsted acid Brønsted base conjugate base conjugate acid
a. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$
b. $\mathrm{HSO}_{4}^{-}$
$\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}$
$\mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-}$ $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NH}^{+}$
c. $\left[\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$
$\mathrm{N}_{2} \mathrm{H}_{4}$ $\mathrm{SO}_{4}{ }^{2-}$
$\mathrm{N}_{2} \mathrm{H}_{5}{ }^{+}$
$\mathrm{OH}^{-}$
$\left[\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}(\mathrm{OH})\right]^{2+} \quad \mathrm{H}_{2} \mathrm{O}$
4. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.8 \times 10^{-4} \mathrm{M}$; $\left[\mathrm{OH}^{-}\right]=5.6 \times 10^{-11} \mathrm{M}$; acidic
5. $\mathrm{pH}=11.48$
6. a. $\mathrm{HCO}_{2} \mathrm{H}$; weakest acid $=\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH} \quad$ b. $\mathrm{HCO}_{2} \mathrm{H} \quad$ c. $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$
7. $3.0 \times 10^{-10}$
8. $2.1 \times 10^{-4}$
9. chloroacetic acid
10. a. $\mathrm{OH}^{-}(\mathrm{aq})+\mathrm{HPO}_{4}{ }^{2-}(\mathrm{aq}) \rightleftarrows \mathrm{H}_{2} \mathrm{O}(\ell)+\mathrm{PO}_{4}{ }^{3-}(\mathrm{aq}) \quad$ b. right
11. a. 0.0021 M b. $3.6 \times 10^{-4}$
12. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=8.1 \times 10^{-11} \mathrm{M} ;\left[\mathrm{OH}^{-}\right]=1.2 \times 10^{-4} \mathrm{M}$
b. $9.7 \times 10^{-7}$
13. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.5 \times 10^{-6} \mathrm{M} ; \mathrm{pH}=5.83$
14. $\mathrm{pH}=8.84$
15. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.1 \times 10^{-5} \mathrm{M} ; \mathrm{pH}=4.98$
16. a. Lewis base b. Lewis acid c. Lewis base
17. a. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and $\mathrm{NH}_{4} \mathrm{Cl} \quad$ b. $\mathrm{NH}_{3}, \mathrm{Na}_{2} \mathrm{CO}_{3}$, and $\mathrm{NaCH}_{3} \mathrm{CO}_{2} \quad$ c. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$
18. Answers:

$$
\begin{array}{ll}
\mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftarrows \mathrm{HCO}_{2}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) & K_{\mathrm{a}}=1.8 \times 10^{-4} \\
\mathrm{OH}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \rightleftarrows 2 \mathrm{H}_{2} \mathrm{O}(\ell) & K=1 / K_{\mathrm{w}} \\
\mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftarrows \mathrm{H}_{2} \mathrm{O}(\ell)+\mathrm{HCO}_{2}^{-}(\mathrm{aq}) & K=\left(1.8 \times 10^{-4}\right) / K_{\mathrm{w}}=1.8 \\
\times 10^{10} &
\end{array}
$$

## CH 223 Practice Problem Set \#3

This is a practice problem set and not the actual graded problem set that you will turn in for credit. Answers to each problem can be found at the end of this assignment.

## Covering: Chapter Fourteen Part II and Chapter Guide Three

Important Tables and/or Constants: "Titration Guide" (Handout), "Buffers and Henderson-Hasselbalch Guide" (Handout) and the Table of Acids and Bases for CH 223 (in problem set \#3), $\mathbf{K}_{\mathbf{w}}=\mathbf{1 . 0 0} \mathbf{x 1 0 - 1 4}$ at $25^{\circ} \mathrm{C}$

1. Calculate the hydronium ion concentration and pH of the solution that results when 22.0 mL of 0.15 M acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$, is mixed with 22.0 mL of 0.15 M NaOH .
2. For each of the following cases, decide whether the pH is less than 7 , equal to 7 , or greater than 7.
a. equal volumes of 0.10 M acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$, and 0.10 M KOH are mixed
b. $25 \mathrm{~mL}^{2} 0.015 \mathrm{M} \mathrm{NH}_{3}$ is mixed with 25 mL of 0.015 M HCl
c. 150 mL of $0.20 \mathrm{M} \mathrm{HNO}_{3}$ is mixed with 75 mL of 0.40 M NaOH
3. Does the pH of the solution increase, decrease, or stay the same when you
a. Add solid ammonium chloride to a dilute aqueous solution of $\mathrm{NH}_{3}$ ?
b. Add solid sodium acetate to a dilute aqueous solution of acetic acid?
c. Add solid NaCl to a dilute aqueous solution of NaOH ?
4. What is the pH of a solution that consists of 0.20 M ammonia, $\mathrm{NH}_{3}$, and 0.20 M ammonium chloride, $\mathrm{NH}_{4} \mathrm{Cl}$ ?
5. What is the pH of the solution that results from adding 30.0 mL of 0.015 M KOH to 50.0 mL of 0.015 M benzoic acid?
6. What mass of sodium acetate, $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$, must be added to 1.00 L of 0.10 M acetic acid to give a solution with a pH of 4.50 ?
7. What is the pH of the buffer solution that contains 2.2 g of $\mathrm{NH}_{4} \mathrm{Cl}$ in 250 mL of $0.12 \mathrm{M} \mathrm{NH}_{3}$ ? Is the final pH lower or higher than the pH of the original ammonia solution?
8. A buffer is composed of formic acid and its conjugate base, the formate ion.
a. What is the pH of a solution that has a formic acid concentration of 0.050 M and a sodium formate concentration of 0.035 M ?
b. What must the ratio of acid to conjugate base be to increase the pH by 0.5 unit?
9. Calculate the pH of a solution that has an acetic acid concentration of 0.050 M and a sodium acetate concentration of 0.075 M .
10. Which of the following combinations would be the best to buffer the pH of a solution at approximately 9 ?
a. HCl and NaCl
b. $\mathrm{NH}_{3}$ and $\mathrm{NH}_{4} \mathrm{Cl}$
c. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$
11. Describe how to prepare a buffer solution from $\mathrm{NaH}_{2} \mathrm{PO}_{4}$ and $\mathrm{Na}_{2} \mathrm{HPO}_{4}$ to have a pH of 7.5.
12. A buffer solution was prepared by adding 4.95 g of sodium acetate, $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$, to $2.50 \times 10^{2}$ mL of 0.150 M acetic acid, $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$.
a. What is the pH of the buffer?
b. What is the pH of $1.00 \times 10^{2} \mathrm{~mL}$ of the buffer solution if you add 82 mg of NaOH to the solution?
13. A buffer solution is prepared by adding 0.125 mol of ammonium chloride to $5.00 \times 102 \mathrm{~mL}$ of 0.500 M solution of ammonia.
a. What is the pH of the buffer?
b. If 0.0100 mol of HCl gas is bubbled into $5.00 \times 10^{2} \mathrm{~mL}$ of the buffer, what is the new pH of the solution?
14. Phenol, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$, is a weak organic acid. Suppose 0.515 g of the compound is dissolved in exactly 125 mL of water. The resulting solution is titrated with 0.123 M NaOH .

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftarrows \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

a. What is the pH of the original solution of phenol?
b. What are the concentrations of all of the following ions at the equivalence point: $\mathrm{Na}^{+}$, $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OH}^{-}$, and $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-1}$ ?
c. What is the pH of the solution at the equivalence point?
15. You require 36.78 mL of 0.0105 M HCl to reach the equivalence point in the titration of 25.0 mL of aqueous ammonia.
a. What was the concentration of $\mathrm{NH}_{3}$ in the original ammonia solution?
b. What are the concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{OH}^{-1}$, and $\mathrm{NH}_{4}^{+}$at the equivalence point?
c. What is the pH of the solution at the equivalence point?
16. For the titration of 50.0 mL of 0.150 M ethylamine, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}$, with 0.100 M HCl , find the pH at each of the following points and then use that information to sketch the titration curve and decide on an appropriate indicator.
a. at the beginning, before HCl is added
b. at the halfway point in the titration
c. when $75 \%$ of the required acid has been added
d. at the equivalence point
e. when 10.0 mL more HCl has been added than is required
f. Sketch the titration curve.
g. Suggest an appropriate indicator for this titration.
17. You titrate 25.0 mL of 0.10 M NH 3 with 0.10 M HCl .
a. What is the pH of the NH 3 solution before the titration begins?
b. What is the pH at the equivalence point?
c. What is the pH at the halfway point of the titration?
d. What indicator in Figure 18.10 could be used to detect the equivalence point?
e. Calculate the pH of the solution after adding $5.00,15.0,20.0,22.0$, and 30.0 mL of the acid. Combine this information with that in parts (a)-(c) and plot the titration curve.
18. Aniline hydrochloride, $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}\right) \mathrm{Cl}$, is a weak acid with a conjugate base aniline $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}\right)$. The acid can be titrated with a strong base such as NaOH . Assume 50.0 mL of 0.100 M aniline hydrochloride is titrated with 0.185 M NaOH ( $K_{\mathrm{a}}$ for aniline hydrochloride is $\left.2.4 \times 10^{-5}.\right)$ The equation: $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftarrows \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\ell)$
a. What is the pH of the $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}\right) \mathrm{Cl}$ solution before the titration begins?
b. What is the pH at the equivalence point?
c. What is the pH at the half-equivalence point?
d. Calculate the pH of the solution after adding $10.0,20.0$ and 30.0 mL of base.

## Answers to the Practice Problem Set:

1. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.5 \times 10^{-9} \mathrm{M} ; \mathrm{pH}=8.81$
2. a. $>7$ b. $<7$ c. $=7$
3. a. decreases b. increases c. no change
4. 9.25
5. 4.38
6. 4.7 g
7. $\mathrm{pH}=9.11$; lower pH than original solution
8. a. 3.59 b. 0.45
9. 4.92
10. answer (b)
11.2 mol of base for every 1 mol of acid to some amount of water
12.a. 4.95 b. 5.05
13.a. 9.55 b. 9.50
11. a. $\mathrm{pH}=5.62$ b. $\left[\mathrm{Na}^{+}\right]=0.0323 \mathrm{M},\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=6.5 \times 10^{-12} \mathrm{M},\left[\mathrm{OH}^{-}\right]=0.0015 \mathrm{M},\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-}\right]=$ $0.0307 \mathrm{M} \quad$ c. $\mathrm{pH}=11.19$
12. a. $\left[\mathrm{NH}_{3}\right]=0.0154 \mathrm{M} \quad$ b. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.9 \times 10^{-6} \mathrm{M},\left[\mathrm{OH}^{-}\right]=5.3 \times 10^{-9} \mathrm{M}, \quad\left[\mathrm{NH}_{4}^{+}\right]=0.00625$ M c. $\mathrm{pH}=5.73$
13. a. $\mathrm{pH}=11.89$ b. $\mathrm{pH}=10.63$ c. $\mathrm{pH}=10.15 \quad$ d. $\mathrm{pH}=5.93 \quad$ e. $\mathrm{pH}=2.13 \quad$ f. $\mathrm{WB}+\mathrm{SA}$ curve (see titration lab) g. Alizarin or bromcresol purple (two possible examples)
14. a. $\mathrm{pH}=11.13$ b. $\mathrm{pH}=5.28$ c. $\mathrm{pH}=9.25 \quad$ d. methyl red (one possible answer) e. at 5.00 $\mathrm{mL}, \mathrm{pH}=9.85$; at $15.00 \mathrm{~mL}, \mathrm{pH}=9.08$; at $20.00 \mathrm{~mL}, \mathrm{pH}=8.65$; at $22.00 \mathrm{~mL}, \mathrm{pH}=8.39$; at $30.00 \mathrm{~mL}, \mathrm{pH}=2.04$; graph $=\mathrm{WB}+\mathrm{SA}$ curve (see titration lab)
15. a. $\mathrm{pH}=2.81$ b. $\mathrm{pH}=8.72$ c. $\mathrm{pH}=4.62$ d. at $10.00 \mathrm{~mL}, \mathrm{pH}=4.39$; at $20.00 \mathrm{~mL}, \mathrm{pH}=5.07$; at $30.00 \mathrm{~mL}, \mathrm{pH}=11.84$

## CH 223 Practice Problem Set \#4

This is a practice problem set and not the actual graded problem set that you will turn in for credit.
Answers to each problem can be found at the end of this assignment.

Covering: Chapter Fifteen (solubility), Chapter Sixteen and Chapter Guide Four
Important Tables and/or Constants: Solubility Table (from the CH 221 Net Ionics lab or here: https://mhchem.org/ sol), "Solubility Product Constant $\left(\mathbf{K}_{\mathbf{s p}}\right)$ Values at $25{ }^{\circ} \mathbf{C}$ " and "Complex Ion Formation Constant $\left(\mathbf{K}_{\mathbf{f}}\right)$ Values at $\mathbf{2 5}{ }^{\circ} \mathbf{C}$ " at the end of problem set \#4, "Solubility Guide" (Handout), Table of Thermodynamic Values (found at the end of CH 223 Problem Set \#5 or here: http://mhchem.org/thermo)

1. Predict whether each of the following is insoluble or soluble in water.
a. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}$
b. $\mathrm{ZnSO}_{4}$
c. NiS
d. $\mathrm{BaSO}_{4}$
2. For each of the following insoluble salts, (i) write a balanced equation showing the equilibrium occurring when the salt is added to water and (ii) write the $K_{\text {sp }}$ expression.
a. AgCN
b. $\mathrm{NiCO}_{3}$
c. $\mathrm{AuBr}_{3}$
3. When 1.55 g of solid thallium(I) bromide is added to 1.00 L of water, the salt dissolves to a small extent.

$$
\mathrm{TlBr}(\mathrm{~s}) \rightleftarrows \mathrm{Tl}^{+}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq})
$$

The thallium(I) and bromide ions in equilibrium with TlBr each have a concentration of 1.9 x $10^{-3} \mathrm{M}$. What is the value of $K_{\text {sp }}$ for TlBr ?
4. You add 0.979 g of $\mathrm{Pb}(\mathrm{OH})_{2}$ to 1.00 L of pure water at $25^{\circ} \mathrm{C}$. The pH is 9.15 . Estimate the value of $K_{\text {sp }}$ for $\mathrm{Pb}(\mathrm{OH})_{2}$.
5. Estimate the solubility of calcium fluoride, $\mathrm{CaF}_{2}$, (a) in moles per liter and (b) in grams per liter of pure water.

$$
\mathrm{CaF}_{2}(\mathrm{~s}) \rightleftarrows \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{~F}^{-1}(\mathrm{aq}) \quad K_{\mathrm{sp}}=5.3 \times 10^{-11}
$$

6. The $K_{\text {sp }}$ value for radium sulfate, $\mathrm{RaSO}_{4}$, is $3.7 \times 10^{-11}$. If 25 mg of radium sulfate is placed in $1.00 \times 10^{2} \mathrm{~mL}$ of water, does all of it dissolve? If not, how much dissolves?
7. Use $K_{\text {sp }}$ values to decide which compound in each of the following pairs is the more soluble.
a. $\mathrm{PbCl}_{2}\left(K_{\mathrm{Sp}}=1.7 \times 10^{-5}\right)$ or $\mathrm{PbBr}_{2}\left(K_{\mathrm{Sp}}=6.6 \times 10^{-6}\right)$
b. $\mathrm{HgS}\left(K_{\mathrm{sp}}=4.2 \times 10^{-11}\right)$ or $\mathrm{FeS}\left(K_{\mathrm{Sp}}=8.0 \times 10^{-19}\right)$
c. $\mathrm{Fe}(\mathrm{OH})_{2}\left(K_{\mathrm{Sp}}=4.9 \times 10^{-17}\right)$ or $\mathrm{Zn}(\mathrm{OH})_{2}\left(K_{\mathrm{Sp}}=3.0 \times 10^{-17}\right)$
8. Compare the solubility, in milligrams per milliliter, of silver iodide, AgI, (a) in pure water and (b) in water that is $0.020 \mathrm{M} \mathrm{in}_{\mathrm{AgNO}_{3}}$. $\left(K_{\text {Sp }}\right.$ for $\left.\mathrm{AgI}=8.5 \times 10^{-17}\right)$
9. You have a solution that has a lead(II) concentration of 0.0012 M .
$\mathrm{PbCl}_{2}(\mathrm{~s}) \rightleftarrows \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{Cl}^{-1}(\mathrm{aq})$
If enough soluble chloride-containing salt is added so that the $\mathrm{Cl}^{-1}$ concentration is 0.010 M , will $\mathrm{PbCl}_{2}$ precipitate? $\left(K_{\mathrm{sp}}\right.$ for $\left.\mathrm{PbCl}_{2}=1.7 \times 10^{-5}\right)$
10. Solid gold(I) chloride, AuCl , dissolves when excess cyanide ion, $\mathrm{CN}^{-1}$, is added to give a water-soluble complex ion.

$$
\mathrm{AuCl}(\mathrm{~s})+2 \mathrm{CN}^{-1}(\mathrm{aq}) \rightleftarrows\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-1}(\mathrm{aq})+\mathrm{Cl}^{-1}(\mathrm{aq})
$$

Show that this equation is the sum of two other equations, one for dissolving AuCl to give its ions ( $K_{\text {sp }}=2.0 \times 10^{-13}$ ) and the other for the formation of the $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-1}$ ion (using $K_{\text {form }}=$ $2.0 \times 10^{38}$ ) from $\mathrm{Au}^{+1}$ and $\mathrm{CN}^{-1}$. Calculate $K_{\text {net }}$ for the overall reaction.
12. Each pair of ions below is found together in aqueous solution. Using a table of solubility product constants, devise a way to separate these ions by precipitating one of them as an insoluble salt and leaving the other in solution.
a. $\mathrm{Ba}^{2+}$ and $\mathrm{Na}^{+}$
b. $\mathrm{Ni}^{2+}$ and $\mathrm{Pb}^{2+}$
13. A solution contains $\mathrm{Ca}^{2+}$ and $\mathrm{Pb}^{2+}$ ions, both at a concentration of 0.010 M . You wish to separate the two ions from each other as completely as possible by precipitating one but not the other using aqueous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ as the precipitating agent.
a. Which will precipitate first as sodium sulfate is added, $\mathrm{CaSO}_{4}$ or $\mathrm{PbSO}_{4}$ ?
b. What will be the concentration of the first ion that precipitates $\left(\mathrm{Ca}^{2+}\right.$ or $\left.\mathrm{Pb}^{2+}\right)$ when the second, more soluble salt begins to precipitate?
14. Explain why the solubility of $\mathrm{Ag}_{3} \mathrm{PO}_{4}$ can be greater in water than is calculated from the $K_{\text {sp }}$ value of the salt.
15. Which substance has the higher entropy in each of the following pairs?
a. dry ice (solid $\mathrm{CO}_{2}$ ) at $-78^{\circ} \mathrm{C}$ or $\mathrm{CO}_{2}(\mathrm{~g})$ at $0^{\circ} \mathrm{C}$
b. liquid water at $25^{\circ} \mathrm{C}$ or liquid water at $50^{\circ} \mathrm{C}$
c. pure alumina, $\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})$, or ruby (ruby is $\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})$ in which some of the $\mathrm{Al}^{3+}$ ions in the crystalline lattice are replaced with $\mathrm{Cr}^{3+}$ ions.)
d. one mole of $\mathrm{N}_{2}(\mathrm{~g})$ at 1 bar pressure or one mole of $\mathrm{N}_{2}(\mathrm{~g})$ at 10 bar pressure (both at 298 K)
16. By comparing the formulas for each pair of compounds, decide which is expected to have the higher entropy. Assume all are at the same temperature.
a. $\mathrm{O}_{2}(\mathrm{~g})$ or $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{g})$ (two substances with the same molar mass)
b. $\mathrm{HF}(\mathrm{g}), \mathrm{HCl}(\mathrm{g})$, or $\mathrm{HBr}(\mathrm{g})$
c. $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{s})$ or $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})$
d. $\mathrm{HNO}_{3}(\mathrm{~g}), \mathrm{HNO}_{3}(\mathrm{l})$, or $\mathrm{HNO}_{3}(\mathrm{aq})$
17. Use $S^{\circ}$ values to calculate the entropy change, $\Delta S^{\circ}$, for each of the following processes and comment on the sign of the change.
a. $\mathrm{LiOH}(\mathrm{s}) \rightarrow \mathrm{LiOH}(\mathrm{aq}) \quad\left(\right.$ Note: $\left.S^{\circ}(\mathrm{LiOH}(\mathrm{aq}))=91.6 \mathrm{~J} / \mathrm{molK}\right)$
b. $\mathrm{Na}(\mathrm{g}) \rightarrow \mathrm{Na}(\mathrm{s})$
c. $\mathrm{Br}_{2}(\mathrm{l}) \rightarrow \mathrm{Br}_{2}(\mathrm{~g})$
d. $\mathrm{HCl}(\mathrm{g}) \rightarrow \mathrm{HCl}(\mathrm{aq}) \quad$ (Note: $\left.S^{\circ}(\mathrm{HCl}(\mathrm{aq}))=56.5 \mathrm{~J} / \mathrm{molK}\right)$
18. Calculate the standard molar entropy change of formation $\left(\Delta \mathrm{S}_{f}{ }^{\circ}\right)$ for each of the following compounds from the elements at $25^{\circ} \mathrm{C}$.
a. $\mathrm{HCl}(\mathrm{g})$
b. $\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})$
19. Calculate the standard molar entropy change for each of the following reactions at $25^{\circ} \mathrm{C}$. Comment on the sign of $\Delta \mathrm{S}^{\circ}$.
a. $2 \mathrm{Al}(\mathrm{s})+3 \mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{AlCl}_{3}(\mathrm{~s})$
b. $2 \mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

## Answers to the Practice Problem Set:

1. (a) and (b): soluble, (c) and (d): insoluble
2. Answers:
a. $\operatorname{AgCN}(\mathrm{s}) \rightleftarrows \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{CN}^{-}(\mathrm{aq}) \quad K_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{CN}^{-}\right]$
b. $\mathrm{NiCO}_{3}(\mathrm{~s}) \rightleftarrows \mathrm{Ni}^{2+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq}) \quad K_{\text {sp }}=\left[\mathrm{Ni}^{2+}\right]\left[\mathrm{CO}_{3}{ }^{2-}\right]$
c. $\mathrm{AuBr}_{3}(\mathrm{~s}) \rightleftarrows \mathrm{Au}^{3+}(\mathrm{aq})+3 \mathrm{Br}^{-}(\mathrm{aq}) \quad K_{\mathrm{sp}}=\left[\mathrm{Au}^{3+}\right]\left[\mathrm{Br}^{-}\right]^{3}$
3. $3.6 \times 10^{-6}$
4. $1.4 \times 10^{-15}$
5. a. $2.4 \times 10^{-4} \quad$ b. 0.018
6. No; 0.20 mg dissolves
7. a. $\mathrm{PbCl}_{2}$ b. HgS b. $\mathrm{Fe}(\mathrm{OH})_{2}$
8. a. $2.2 \times 10^{-6}$ b. $1.0 \times 10^{-13}$
9. $Q<K_{\text {sp }}$ so no precipitate
10. $Q>K_{\text {sp }}$ so precipitate forms
11. $K_{\text {net }}=4.0 \times 10^{25}$
12. a. $\mathrm{SO}_{4}{ }^{2-}$ will precipitate $\mathrm{Ba}^{2+}$ b. $\mathrm{Cl}^{-1}$ will precipitate $\mathrm{Pb}^{2+}$
13. a. $\mathrm{PbSO}_{4}$ b. $5.1 \times 10^{-6} \mathrm{M}$
14. $\mathrm{PO}_{4}{ }^{3-}$ acts as a base, increasing solubility upon formation of $\mathrm{HPO}_{4}{ }^{2-}$
15. a. $\mathrm{CO}_{2}(\mathrm{~g})$ b. $50^{\circ} \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ c. ruby d. $\mathrm{N}_{2}(\mathrm{~g})$ at 1 bar
16. a. $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{g}) \quad$ b. $\mathrm{HBr}(\mathrm{g}) \quad$ c. $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq}) \quad$ d. $\mathrm{HNO}_{3}(\mathrm{~g})$
17. a. $48.8 \mathrm{~J} / \mathrm{K}$ (entropy increase) b. $-102.4 \mathrm{~J} / \mathrm{K}$ (entropy decrease) c. $93.3 \mathrm{~J} / \mathrm{K}$ (entropy increase) d. $-130.4 \mathrm{~J} / \mathrm{K}$ (entropy decrease) (Instructor note: your values of $\Delta \mathrm{S}$ might be slightly different depending on the textbook used, etc., but they should be close to these values.)
18. a. 10.0 J/K b. -294.1 J/K (see note in answer \#17, above)
19. a. $-504.6 \mathrm{~J} / \mathrm{K}$ (entropy increase) b. $313.6 \mathrm{~J} / \mathrm{K}$ (entropy decrease) (see note in answer \#17, above)

## CH 223 Practice Problem Set \#5

This is a practice problem set and not the actual graded problem set that you will turn in for credit.
Answers to each problem can be found at the end of this assignment.

## Covering: Chapter Sixteen, Chapter Seventeen and Chapter Guide Five

Important Tables and/or Constants: $\mathbf{F}=\mathbf{9 6 4 8 5} \mathbf{C} / \mathbf{m o l ~ e} \mathbf{e}^{-}, \mathbf{R}=\mathbf{8 . 3 1 4 5} \mathbf{J ~ m o l}^{\mathbf{- 1}} \mathbf{K}^{\mathbf{1}}$, "Redox Reactions" (Handout), Table of Redox Potentials at the end of problem set \#5, Table of Thermodynamic values at the end of problem set \#5 and here: http://mhchem.org/thermo

1. Classify each of the reactions according to their spontaneity. Are these reactions enthalpy and/or entropy driven?
a. $\quad \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+2 \mathrm{Al}(\mathrm{s}) \rightarrow 2 \mathrm{Fe}(\mathrm{s})+\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s}) \quad \Delta H^{\circ}=-851.5 \mathrm{~kJ} \quad \Delta S^{\circ}=-375.2 \mathrm{~J} / \mathrm{K}$
b. $\mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO}_{2}(\mathrm{~g}) \quad \Delta H^{\circ}=66.2 \mathrm{~kJ} ; \quad \Delta \mathrm{S}^{\circ}=-121.6 \mathrm{~J} / \mathrm{K}$
2. Heating some metal carbonates, among them magnesium carbonate, leads to their decomposition.

$$
\mathrm{MgCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{MgO}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

a. Calculate $\Delta \mathrm{H}^{\circ}$ and $\Delta \mathrm{S}^{\circ}$ for the reaction.
b. Is the reaction spontaneous at 298 K ?
c. Is the reaction predicted to be spontaneous at higher temperatures?
3. Using values of $\Delta H^{\circ}{ }_{f}$ and $S^{\circ}$, calculate $\Delta G^{\circ}{ }_{r x n}$ for the following reaction. Is the reaction product-favored? Is the reaction enthalpy or entropy driven?

$$
2 \mathrm{~Pb}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{PbO} \text { (s, yellow) }
$$

4. Using values of $\Delta G^{\circ}{ }_{f}$, calculate $\Delta G^{\circ}{ }_{\text {rxn }}$ for each of the following reactions. Which are product-favored?
a. $2 \mathrm{~K}(\mathrm{~s})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{KCl}(\mathrm{s})$
b. $2 \mathrm{CuO}(\mathrm{s}) \rightarrow 2 \mathrm{Cu}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g})$
c. $4 \mathrm{NH}_{3}(\mathrm{~g})+7 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{NO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
5. For the reaction: $\mathrm{BaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{BaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g}), \Delta{G^{\circ}}^{\circ}{ }_{\mathrm{rxn}}=+219.7 \mathrm{~kJ}$. Using this value and a table of thermodynamic data, calculate the value of $\Delta G_{f}^{\circ}$ for $\mathrm{BaCO}_{3}(\mathrm{~s})$.
6. Estimate the temperature required to decompose $\mathrm{HgS}(\mathrm{s})$ into $\mathrm{Hg}(\mathrm{l})$ and $\mathrm{S}(\mathrm{g})$.
7. Calculate $\Delta G^{\circ}$ and $K_{\mathrm{p}}$ at $25^{\circ} \mathrm{C}$ for the reaction: $2 \mathrm{HBr}(\mathrm{g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{HCl}(\mathrm{g})+\mathrm{Br}_{2}(\mathrm{l})$ Is the reaction predicted to be product-favored under standard conditions? Comment on the sign of $\Delta \mathrm{G}^{\circ}$ and the magnitude of $K_{\mathrm{p}}$.
8. Write balanced equations for the following half-reactions. Specify whether each is an oxidation or reduction.
a. $\mathrm{Cr}(\mathrm{s}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq}) \quad$ (in acid)
b. $\mathrm{AsH}_{3}(\mathrm{~g}) \rightarrow \mathrm{As}(\mathrm{s}) \quad$ (in acid)
c. $\mathrm{VO}_{3}{ }^{-1}(\mathrm{aq}) \rightarrow \mathrm{V}^{2+}(\mathrm{aq})$ (in acid)
d. $\mathrm{Ag}(\mathrm{s}) \rightarrow \mathrm{Ag}_{2} \mathrm{O}$ (s) (in base)
9. Balance the following redox equations. All occur in acid solution.
a. $\mathrm{Ag}(\mathrm{s})+\mathrm{NO}_{3}{ }^{-1}(\mathrm{aq}) \rightarrow \mathrm{NO}_{2}(\mathrm{~g})+\mathrm{Ag}^{+}(\mathrm{aq})$
b. $\mathrm{MnO}_{4}^{-1}(\mathrm{aq})+\mathrm{HSO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Mn}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
c. $\mathrm{Zn}(\mathrm{s})+\mathrm{NO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$
d. $\mathrm{Cr}(\mathrm{s})+\mathrm{NO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{NO}(\mathrm{g})$
10. Balance the following redox equations. All occur in basic solution.
a. $\mathrm{Al}(\mathrm{s})+\mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Al}(\mathrm{OH})_{4}^{-1}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
b. $\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq}) \rightarrow \mathrm{Cr}(\mathrm{OH})_{3}(\mathrm{~s})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
c. $\mathrm{Zn}(\mathrm{s})+\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$
d. $\mathrm{HS}^{-1}(\mathrm{aq})+\mathrm{ClO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{S}(\mathrm{s})+\mathrm{Cl}^{-1}(\mathrm{aq})$
11. A voltaic cell is constructed using the reaction of chromium metal and iron(II) ion.

$$
2 \mathrm{Cr}(\mathrm{~s})+3 \mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow 2 \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{Fe}(\mathrm{~s})
$$

Complete the following sentences: Electrons in the external circuit flow from the electrode to the ___ electrode. Negative ions move in the salt bridge from the $\qquad$ half-cell to the $\qquad$ half-cell. The half-reaction at the anode is $\qquad$ and that at the cathode is $\qquad$ .
12. The half-cells $\mathrm{Fe}(\mathrm{s})\left|\mathrm{Fe}^{2+}(\mathrm{aq}) \| \mathrm{O}_{2}(\mathrm{~g}, 1 \mathrm{~atm})\right| \mathrm{H}_{2} \mathrm{O}(1, \mathrm{pH}=1.0)$ are linked to create a voltaic cell.
a. Write equations for the oxidation and reduction half-reactions and for the overall (cell) reaction.
b. Which half-reaction occurs in the anode compartment and which occurs in the cathode compartment?
c. Complete the following sentences: Electrons in the external circuit flow from the electrode to the $\qquad$ electrode. Negative ions move in the salt bridge from the ___ halfcell to the $\qquad$ half-cell.
13. Balance each of the following unbalanced equations, then calculate the standard redox potential, $E^{\circ}$, and decide whether each is product-favored as written. All reactions occur in acid solution.
a. $\mathrm{Sn}^{2+}(\mathrm{aq})+\mathrm{Ag}(\mathrm{s}) \rightarrow \mathrm{Sn}(\mathrm{s})+\mathrm{Ag}^{+1}(\mathrm{aq})$
b. $\mathrm{Al}(\mathrm{s})+\mathrm{Sn}^{4+}(\mathrm{aq}) \rightarrow \mathrm{Sn}^{2+}(\mathrm{aq})+\mathrm{Al}^{3+}(\mathrm{aq})$
c. $\mathrm{ClO}_{3}{ }^{-1}(\mathrm{aq})+\mathrm{Ce}^{3+}(\mathrm{aq}) \rightarrow \mathrm{Cl}^{-1}(\mathrm{aq})+\mathrm{Ce}^{4+}(\mathrm{aq}) \quad$ Look these cell potentials up online
d. $\mathrm{Cu}(\mathrm{s})+\mathrm{NO}_{3}^{-1}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{NO}(\mathrm{g})$
14. Consider the following half-reactions:

| Half-Reaction | $\boldsymbol{E}^{\circ}(\mathbf{V})$ |
| :--- | :--- |
| $\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{s})$ | +0.34 |
| $\mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Sn}(\mathrm{s})$ | -0.14 |
| $\mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Fe}(\mathrm{s})$ | -0.44 |
| $\mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Zn}(\mathrm{s})$ | -0.76 |
| $\mathrm{Al}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{Al}(\mathrm{s})$ | -1.66 |

a. Based on $E^{\circ}$ values, which metal is the most easily oxidized?
b. Which metals on this list are capable of reducing $\mathrm{Fe}^{2+}(\mathrm{aq})$ to Fe ?
c. Write a balanced chemical equation for the reaction of $\mathrm{Fe}^{2+}(\mathrm{aq})$ with $\mathrm{Sn}(\mathrm{s})$. Is this reaction product-favored or reactant-favored?
d. Write a balanced chemical equation for the reaction of $\mathrm{Zn}^{2+}(\mathrm{aq})$ with $\mathrm{Sn}(\mathrm{s})$. Is this reaction product-favored or reactant-favored?
15. Calculate the voltage delivered by a voltaic cell using the following reaction if all dissolved species are $2.5 \times 10^{-2} \mathrm{M}$. Use the OpenStax text to find the cell potentials.

$$
\mathrm{Zn}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{OH}^{-1}(\mathrm{aq}) \rightarrow\left[\mathrm{Zn}(\mathrm{OH})_{4}\right]^{2-}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

16. Calculate $\Delta G^{\circ}$ and the equilibrium constant for the following reactions.
a. $2 \mathrm{Fe}^{3+}(\mathrm{aq})+2 \mathrm{I}^{-1}(\mathrm{aq}) \rightarrow 2 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq})$
b. $\mathrm{I}_{2}(\mathrm{aq})+2 \mathrm{Br}^{-1}(\mathrm{aq}) \rightarrow 2 \mathrm{I}^{-1}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{aq})$
17. A potential of +0.146 V is recorded (under standard conditions) for a voltaic cell constructed using the following half-reactions:

Anode: $\mathrm{Ag}(\mathrm{s}) \rightarrow \mathrm{Ag}^{+1}(\mathrm{aq})+\mathrm{e}^{-}$
Cathode: $\mathrm{Ag}_{2} \mathrm{SO}_{4}(\mathrm{~s})+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{Ag}(\mathrm{s})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
a. What is the standard reduction potential for the cathode reaction?
b. Calculate the solubility product, $K_{\mathrm{sp}}$, for $\mathrm{Ag}_{2} \mathrm{SO}_{4}$.
18. In the electrolysis of a solution containing $\mathrm{Ni}^{2+}(\mathrm{aq})$, metallic $\mathrm{Ni}(\mathrm{s})$ deposits on the cathode. Using a current of 0.150 A for 12.2 min , what mass of nickel will form?
19. Electrolysis of a solution of $\mathrm{CuSO}_{4}(\mathrm{aq})$ to give copper metal is carried out using a current of 0.66 A. How long should electrolysis continue to produce 0.50 g of copper?
20. Electrolysis of molten NaCl is done in cells operating at 7.0 V and $4.0 \times 10^{4} \mathrm{~A}$. What mass of $\mathrm{Na}(\mathrm{s})$ and $\mathrm{Cl}_{2}(\mathrm{~g})$ can be produced in one day in such a cell? What is the energy consumption in kilowatt-hours? $\left(1 \mathrm{kWh}=3.6 \times 10^{6} \mathrm{~J}\right.$ and $\left.1 \mathrm{~J}=1 \mathrm{C} \cdot \mathrm{V}\right)$

Answers to the Practice Problem Set: Please note that all thermodynamic and electrochemical answers will vary slightly depending on the source of values used to solve the problems. The answers should be close, however.

1. a. enthalpy driven, spontaneous at low temperatures b. non-spontaneous at all temperatures
2. a. $\Delta H^{0}=191.59 \mathrm{~kJ}, \Delta S^{\mathrm{o}}=141.9 \mathrm{~J} / \mathrm{K}$ b. no c. yes
3. $\Delta H^{\mathrm{o}}=-434.64 \mathrm{~kJ}, \Delta S^{\mathrm{o}}=-197.4 \mathrm{~J} / \mathrm{K}, \Delta G^{\mathrm{o}}=-375.77 \mathrm{~kJ}$; product favored, enthalpy driven
4. a. $\Delta G^{\mathrm{o}}=-817.0 \mathrm{~kJ}$; product favored b. $\Delta G^{\mathrm{o}}=259.4 \mathrm{~kJ}$; reactant favored
c. $\Delta G^{\mathrm{o}}=-1101.3$ kJ ; product favored
5. $\Delta G_{f}^{\rho}\left[\mathrm{BaCO}_{3}(\mathrm{~s})\right]=-1134.4 \mathrm{~kJ} / \mathrm{mol}$
6. 2089 K or greater
7. $\Delta G^{\mathrm{o}}=-83.74 \mathrm{~kJ} ; K_{\mathrm{p}}=4.8 \times 10^{14}$ Negative $\Delta \mathrm{G}$ and large $K_{\mathrm{p}}$ indicate product-favored reaction
8. Answers:
a. $\mathrm{Cr}(\mathrm{s}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-}$
b. $\mathrm{AsH}_{3}(\mathrm{~g}) \rightarrow \mathrm{As}(\mathrm{s})+3 \mathrm{H}^{+}(\mathrm{aq})+3 \mathrm{e}^{-}$
c. $\mathrm{VO}_{3}^{-}(\mathrm{aq})+6 \mathrm{H}^{+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{V}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\ell)$
d. $2 \mathrm{Ag}(\mathrm{s})+2 \mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{Ag}_{2} \mathrm{O}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}(\ell)+2 \mathrm{e}^{-}$
oxidation
oxidation
reduction
oxidation
9. Answers:
a. $\mathrm{Ag}(\mathrm{s})+\mathrm{NO}_{3}-(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{NO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\ell)$
b. $2 \mathrm{MnO}_{4}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})+5 \mathrm{HSO}_{3}-(\mathrm{aq}) \rightarrow 2 \mathrm{Mn}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\ell)+5 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
c. $4 \mathrm{Zn}(\mathrm{s})+2 \mathrm{NO}_{3}^{-}(\mathrm{aq})+10 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 5 \mathrm{H}_{2} \mathrm{O}(\ell)+4 \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{N}_{2} \mathrm{O}(\mathrm{g})$
d. $\mathrm{Cr}(\mathrm{s})+\mathrm{NO}_{3}-(\mathrm{aq})+4 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{NO}(\mathrm{g})+2 \mathrm{H}_{2} \mathrm{O}(\ell)$
10. Answers:
a. $2 \mathrm{Al}(\mathrm{s})+6 \mathrm{H}_{2} \mathrm{O}(\ell)+2 \mathrm{OH}^{-}(\mathrm{aq}) \rightarrow 2 \mathrm{Al}(\mathrm{OH})_{4}^{-}(\mathrm{aq})+3 \mathrm{H}_{2}(\mathrm{~g})$
b. $2 \mathrm{CrO}_{4}^{-}(\mathrm{aq})+5 \mathrm{H}_{2} \mathrm{O}(\ell)+3 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq}) \rightarrow 2 \mathrm{Cr}(\mathrm{OH})_{3}(\mathrm{~s})+4 \mathrm{OH}^{-}(\mathrm{aq})+3 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
c. $\mathrm{Zn}(\mathrm{s})+2 \mathrm{OH}^{-}(\mathrm{aq})+\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow \mathrm{Zn}(\mathrm{OH})_{4^{2-}}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$
d. $3 \mathrm{HS}^{-}(\mathrm{aq})+\mathrm{ClO}_{3}^{-}(\mathrm{aq}) \rightarrow 3 \mathrm{~S}(\mathrm{~s})+\mathrm{Cl}^{-}(\mathrm{aq})+3 \mathrm{OH}^{-}(\mathrm{aq})$
11. Electrons in the external circuit flow from the Cr electrode to the Fe electrode. Negative ions move in the salt bridge from the $\mathrm{Fe} / \mathrm{Fe}^{2+}$ half-cell to the $\mathrm{Cr} / \mathrm{Cr}^{3+}$ half-cell. The half-reaction at the anode is $\mathrm{Cr}(\mathrm{s}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-}$and that at the cathode is $\mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Fe}(\mathrm{s})$.
12. Answers:
a. Oxidation: $\mathrm{Fe}(\mathrm{s}) \rightarrow \mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$

Reduction: $\mathrm{O}_{2}(\mathrm{~g})+4 \mathrm{H}^{+}(\mathrm{aq})+4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\ell)$
Overall: $2 \mathrm{Fe}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g})+4 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\ell)+2 \mathrm{Fe}^{2+}(\mathrm{aq})$
b. Oxidation occurs in the anode compartment and reduction occurs in the cathode compartment.
c. Electrons in the external circuit flow from the Fe electrode to the positive (site of $\mathrm{O}_{2}$ reduction) electrode. Negative ions move in the salt bridge from the $\mathrm{O}_{2} / \mathrm{H}_{2} \mathrm{O}$ half-cell to the $\mathrm{Fe} / \mathrm{Fe}^{2+}$ half-cell.

## 13. Answers:

a. $\mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{Ag}(\mathrm{s}) \rightarrow \mathrm{Sn}(\mathrm{s})+2 \mathrm{Ag}^{+}(\mathrm{aq})$
$E_{\text {cell }}^{\mathrm{o}}=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(-0.14 \mathrm{~V})-(+0.799 \mathrm{~V})=-0.94 \mathrm{~V} \quad$ not product-favored
b. $2 \mathrm{Al}(\mathrm{s})+3 \mathrm{Sn}^{4+}(\mathrm{aq}) \rightarrow 2 \mathrm{Al}^{3+}(\mathrm{aq})+3 \mathrm{Sn}^{2+}(\mathrm{aq})$
$E_{\text {cell }}^{\mathrm{o}}=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(+0.15 \mathrm{~V})-(-1.66 \mathrm{~V})=+1.81 \mathrm{~V}$ product-favored
c. $\mathrm{ClO}_{3}-(\mathrm{aq})+6 \mathrm{H}^{+}(\mathrm{aq})+6 \mathrm{Ce}^{3+}(\mathrm{aq}) \rightarrow \mathrm{Cl}-(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\ell)+6 \mathrm{Ce}^{4+}(\mathrm{aq})$
$E^{\mathrm{o}}$ cell $=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(+0.62 \mathrm{~V})-(+1.61 \mathrm{~V})=-0.99 \mathrm{~V}$ not product-favored
d. $3 \mathrm{Cu}(\mathrm{s})+2 \mathrm{NO}_{3}^{-}(\mathrm{aq})+8 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow 2 \mathrm{NO}(\mathrm{g})+3 \mathrm{Cu}^{2+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\ell)$
$E_{\text {cell }}^{\mathrm{o}}=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(+0.96 \mathrm{~V})-(+0.337 \mathrm{~V})=+0.62 \mathrm{~V}$ product-favored
14. Answers:
a. $\mathrm{Al}(\mathrm{s})$
b. $\mathrm{Zn}(\mathrm{s})$ and $\mathrm{Al}(\mathrm{s})$
c. $\mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{Sn}(\mathrm{s}) \rightarrow \mathrm{Fe}(\mathrm{s})+\mathrm{Sn}^{2+}(\mathrm{aq})$

$$
E_{\text {cell }}^{\mathrm{o}}=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(-0.44 \mathrm{~V})-(-0.14 \mathrm{~V})=-0.30 \mathrm{~V} \quad \text { reactant-favored }
$$

d. $\mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Sn}(\mathrm{s}) \rightarrow \mathrm{Zn}(\mathrm{s})+\mathrm{Sn}^{2+}(\mathrm{aq})$
$E_{\text {cell }}^{\mathrm{o}}=E_{\text {cathode }}^{\mathrm{o}}-E_{\text {anode }}^{\mathrm{o}}=(-0.76 \mathrm{~V})-(-0.14 \mathrm{~V})=-0.62 \mathrm{~V} \quad$ reactant-favored
15.0.32 V
16. a. $\Delta G^{\mathrm{o}}=-45.5 \mathrm{~kJ}, K=9 \times 10^{7} \quad$ b. $\Delta G^{\mathrm{o}}=110 \mathrm{~kJ}, K=4 \times 10^{-19}$
17. a. 0.653 V b. $K_{\text {sp }}=1 \times 10^{-5}$
18.0 .0334 g
$19.2300 \mathrm{~s}(38 \mathrm{~min})$
$20.8 .2 \times 10^{5} \mathrm{~g} \mathrm{Na}, 1.3 \times 10^{6} \mathrm{~g} \mathrm{Cl}_{2}, 6700 \mathrm{kwh}$

## CH 223 Practice Problem Set \#6

This is a practice problem set and not the actual graded problem set that you will turn in for credit.
Answers to each problem can be found at the end of this assignment.

Covering: Chapters Eighteen and Chapter Nineteen and Chapter Guide Six
Important Tables and/or Constants: "Coordination Compounds" (Handout)

1. Write balanced chemical equations for the reaction of hydrogen gas with oxygen, chlorine, and nitrogen.
2. Write a balanced chemical equation for the preparation of $\mathrm{H}_{2}$ (and CO ) by the reaction of $\mathrm{CH}_{4}$ and water. Using a table of thermodynamic data, calculate $\Delta H^{\circ}, \Delta \mathrm{G}^{\circ}$, and $\Delta \mathrm{S}^{\circ}$ for this reaction.
3. Complete and balance the equations for the following reactions.
a. $\mathrm{Na}(\mathrm{s})+\mathrm{Br}_{2}(\mathrm{l}) \rightarrow$
b. $\mathrm{Mg}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow$
c. $\mathrm{Al}(\mathrm{s})+\mathrm{F}_{2}(\mathrm{~g}) \rightarrow$
d. $\mathrm{C}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow$ (assume an excess of oxygen has been added)
4. Calcium oxide, CaO , is used to remove $\mathrm{SO}_{2}$ from power plant exhaust. These two compounds react to give solid $\mathrm{CaSO}_{3}$. What mass of $\mathrm{SO}_{2}$ can be removed using $1.2 \times 10^{3} \mathrm{~kg}$ of CaO ?
5. Aluminum dissolves readily in hot aqueous NaOH to give the aluminate ion, $\mathrm{Al}(\mathrm{OH}) 4^{-1}$, and $\mathrm{H}_{2}$. Write a balanced equation for this reaction. If you begin with 13.2 g of Al , what volume (in milliliters) of $\mathrm{H}_{2}$ gas is produced when the gas is measured at 735 mm Hg and $22.5^{\circ} \mathrm{C}$ ?
6. Use a table of thermodynamic data to calculate the enthalpy and free energy change for the reaction: $2 \mathbf{N O}(g)+\mathbf{O}_{2}(g) \rightarrow 2 \mathbf{N O}_{2}(g)$ Is this reaction exothermic or endothermic? Is the reaction product- or reactant-favored?
7. Write the balanced equation for the reaction of hydrazine in acid solution $\left(\mathrm{N}_{2} \mathrm{H}_{5}{ }^{+1}\right)$ with $\mathrm{IO}_{3}{ }^{-1}(\mathrm{aq})$ to give $\mathrm{N}_{2}$ and $\mathrm{I}_{2}$. Calculate $E^{\circ}$ for this reaction using a table of reduction potentials (look online for these values.)
8. If an electrolytic3cell for producing $\mathrm{F}_{2}$ operates at $5.00 \times 10^{3} \mathrm{amps}$ (at 10.0 V ), what mass of $\mathrm{F}_{2}$ can be produced per 24-hour day? Assume the conversion of $\mathrm{F}^{-1}$ to $\mathrm{F}_{2}$ is $100 \%$.
9. When $\mathrm{BCl}_{3}$ gas is passed through an electric discharge, small amounts of the reactive molecule $\mathrm{B}_{2} \mathrm{Cl}_{4}$ are produced. (The molecule has a B-B covalent bond.)
a. Draw a Lewis electron dot structure for $\mathrm{B}_{2} \mathrm{Cl}_{4}$.
b. Describe the hybridization of the B atoms in the molecule and the geometry around each B atom.
10. How would you extinguish a sodium fire in the laboratory? What is the worst thing you could do?
11. You are given a stoppered flask that contains either hydrogen, nitrogen, or oxygen. Suggest an experiment to identify the gas.
12. Halogens form polyhalide ions. Sketch Lewis electron dot structures and describe the molecular geometry for the following ions:
a. $\mathrm{I}_{3}{ }^{-1}$
b. $\mathrm{BrCl}_{2}{ }^{-1}$
c. $\mathrm{ClF}_{2}{ }^{+1}$
13. Give the electron configuration for each of the following ions, and tell whether each is paramagnetic or diamagnetic.
a. $\mathrm{Cr}^{3+}$
b. $\mathrm{V}^{2+}$
c. $\mathrm{Ni}^{2+}$
d. $\mathrm{Cu}^{+}$
14. The following equations represent various ways of obtaining transition metals from their compounds. Balance each equation.
a. $\mathrm{Cr}_{2} \mathrm{O}_{3}(\mathrm{~s})+\mathrm{Al}(\mathrm{s}) \rightarrow \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})+\mathrm{Cr}(\mathrm{s})$
b. $\mathrm{TiCl}_{4}(\mathrm{l})+\mathrm{Mg}(\mathrm{s}) \rightarrow \mathrm{Ti}(\mathrm{s})+\mathrm{MgCl}_{2}(\mathrm{~s})$
c. $\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-1}(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{Ag}(\mathrm{s})+\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-(\mathrm{aq})}$
d. $\mathrm{Mn}_{3} \mathrm{O}_{4}(\mathrm{~s})+\mathrm{Al}(\mathrm{s}) \rightarrow \mathrm{Mn}(\mathrm{s})+\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})$
15. Which of the following ligands is expected to be monodentate and which might be polydentate?
a. $\mathrm{CH}_{3} \mathrm{NH}_{2} \quad$ b. $\mathrm{CH}_{3} \mathrm{CN} \quad$ c. $\mathrm{N}_{3}-1 \quad$ d. en e. $\mathrm{Br}^{-1} \quad$ f. phen
16. Give the oxidation number of the metal ion in each of the following compounds.
a. $\left[\mathrm{Mn}\left(\mathrm{NH}_{3}\right)_{6}\right] \mathrm{SO}_{4}$
b. $\mathrm{K}_{3}\left[\mathrm{Co}(\mathrm{CN})_{6}\right]$
c. $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right] \mathrm{Cl}$
d. $\mathrm{Cr}(\mathrm{en})_{2} \mathrm{Cl}_{2}$
17. Write formulas for the following ions or compounds.
a. dichlorobis(ethylenediamine)nickel(II)
b. potassium tetrachloroplatinate(II)
c. potassium dicyanocuprate(I)
d. tetraamminediaquairon(II)
18. Name the following ions or compounds.
a. $\left[\mathrm{Ni}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2-}$
b. $\left[\mathrm{Co}(\mathrm{en})_{2} \mathrm{Br}_{2}\right]^{+1}$
c. $\left[\mathrm{Co}(\mathrm{en})_{2}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}\right]^{2+}$
d. $\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)$
19. Give the name or formula for each ion or compound, as appropriate.
a. pentaaquahydroxoiron(III) ion
b. $\mathrm{K}_{2}\left[\mathrm{Ni}(\mathrm{CN})_{4}\right]$
c. $\mathrm{K}\left[\mathrm{Cr}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$
d. ammonium tetrachloroplatinate(II)
20. Draw all possible geometric isomers of the following.
a. $\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}$
b. $\operatorname{Pt}\left(\mathrm{NH}_{3}\right)_{2}(\mathrm{SCN})(\mathrm{Br})\left(\mathrm{SCN}^{-1}\right.$ is bonded to $\mathrm{Pt}^{2+}$ through S$)$
c. $\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{2}\left(\mathrm{NO}_{2}\right)_{3}\left(\mathrm{NO}_{2}{ }^{-1}\right.$ is bonded to $\mathrm{Co}^{3+}$ through N$)$
d. $\left[\mathrm{Co}(\mathrm{en}) \mathrm{Cl}_{2}\right]^{-1}$
21. In water, the titanium(III) ion, $\left[\mathrm{Ti}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}$, has a broad absorption band at about 500 nm . What color light is absorbed by the ion?
22. A transition metal complex absorbs $425-\mathrm{nm}$ light. What is its color?
a. red
b. green
c. yellow
d. blue
23. Give the formula of the complex formed from one $\mathrm{Co}^{3+}$ ion, two ethylenediamine molecules, one water molecule, and one chloride ion. Is the complex neutral or charged? If charged, give the net charge on the ion.

## Answers to the Practice Problem Set:

1. Answers:
$2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
$\mathrm{H}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{HCl}(\mathrm{g})$
$3 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{N}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})$
2. $\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow 3 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CO}(\mathrm{g}) ; \Delta H^{\mathrm{o}}=205.9 \mathrm{~kJ}, \Delta S^{\mathrm{o}}=214.7 \mathrm{~J} / \mathrm{K}, \Delta G^{\mathrm{o}}=141.9 \mathrm{~kJ}$ (Note: Answers will vary depending on table used)
3. Answers:
a. $2 \mathrm{Na}(\mathrm{s})+\mathrm{Br}_{2}(\ell) \rightarrow 2 \mathrm{NaBr}(\mathrm{s})$
b. $2 \mathrm{Mg}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{MgO}(\mathrm{s})$
c. $2 \mathrm{Al}(\mathrm{s})+3 \mathrm{~F}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{AlF}_{3}(\mathrm{~g})$
d. $\mathrm{C}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})$
4. $1.4 \times 10^{6} \mathrm{~g}$
5. $2 \mathrm{Al}(\mathrm{s})+2 \mathrm{NaOH}(\mathrm{aq})+6 \mathrm{H}_{2} \mathrm{O}(\ell) \rightarrow 2 \mathrm{Na}^{+}(\mathrm{aq})+2 \mathrm{Al}(\mathrm{OH})_{4}^{-}(\mathrm{aq})+3 \mathrm{H}_{2}(\mathrm{~g}) ; 1.84 \times 10^{4} \mathrm{~mL}$
6. $\Delta H^{\mathrm{o}}=-114.1 \mathrm{~kJ}, \Delta G^{\mathrm{o}}=-72.6 \mathrm{~J} / \mathrm{K}$; exothermic and product-favored
7. $5 \mathrm{~N}_{2} \mathrm{H}_{5}{ }^{+}(\mathrm{aq})+4 \mathrm{IO}_{3}^{-}(\mathrm{aq}) \rightarrow 5 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{I}_{2}(\mathrm{aq})+12 \mathrm{H}_{2} \mathrm{O}(\ell) ; E^{\circ}=(1.195-(-0.23)=$ 1.43 V (Note: Answers will vary depending on table used)
8. $8.51 \times 10^{4} \mathrm{~g}$
9. a. B-B single bond, each B has two Cl atoms connected via sigma bond b. $s p^{2}$, trigonal planar
10. Use inert dry chemical fire extinguisher; Na reacts with water!
11. Insert glowing splint: H will ignite, O will burst into flame, N will extinguish flint 12. Answers:
a. $\left[\begin{array}{ccc}\because & \cdots & \cdots \\ \because \cdot & \ddots & \cdot \\ \cdot & \cdots\end{array}\right]$
linear
b. $\quad\left[\begin{array}{lll}\because \ddot{\mathrm{Cl}}- & \ddot{\mathrm{Br}}- & \ddot{\mathrm{Cl}}: \\ \bullet & \cdot\end{array}\right]$
linear
c. $\left[\begin{array}{lll}\because \ddot{\mathrm{F}} & \ddot{\mathrm{Cl}}- & \ddot{\mathrm{F}} \\ \because & \cdot\end{array}\right]^{+}$
bent
12. a. $[\mathrm{Ar}] 3 d^{3}$, paramagnetic b. $[\mathrm{Ar}] 3 d^{3}$, paramagnetic c. $[\mathrm{Ar}] 3 d^{8}$, paramagnetic d. $[\mathrm{Ar}] 3 d^{10}$, diamagnetic
13. Answers:
a. $\quad \mathrm{Cr}_{2} \mathrm{O}_{3}(\mathrm{~s})+2 \mathrm{Al}(\mathrm{s}) \rightarrow \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})+2 \mathrm{Cr}(\mathrm{s})$
b. $\mathrm{TiCl}_{4}(\ell)+2 \mathrm{Mg}(\mathrm{s}) \rightarrow \mathrm{Ti}(\mathrm{s})+2 \mathrm{MgCl}_{2}(\mathrm{~s})$
c. $2\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]-(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \rightarrow 2 \mathrm{Ag}(\mathrm{s})+\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}(\mathrm{aq})$
d. $3 \mathrm{Mn}_{3} \mathrm{O}_{4}(\mathrm{~s})+8 \mathrm{Al}(\mathrm{s}) \rightarrow 9 \mathrm{Mn}(\mathrm{s})+4 \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})$
14. monodentate: $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{e}$ polydentate: $\mathrm{d}, \mathrm{f}$
15. a. $\mathrm{Mn}^{2+}$ b. $\mathrm{Co}^{3+}$ c. $\mathrm{Co}^{3+}$ d. $\mathrm{Cr}^{2+}$
16. a. $\left[\mathrm{NiCl}_{2}(\mathrm{en})_{2}\right]$
b. $\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]$
c. $\mathrm{K}\left[\mathrm{Cu}(\mathrm{CN})_{2}\right]$
d. $\left[\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$
17. Answers:
a. diaquabis(oxalato)nickelate(II) ion
b. dibromobis(ethylenediamine)cobalt(II) ion
c. amminechlorobis(ethylenediamine)cobalt(III) ion
d. diammineoxalatoplatinum(II)
18. Answers:
(a) $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}\right]^{2+}$
(b) potassium tetracyanonickelate(II)
(c) potassium diaquabis(oxalato)chromate(III)
(d) $\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{PtCl}_{4}\right]$
19. Answers:
a.

b.

20. yellow
21. yellow
22. $\left[\mathrm{Co}(\mathrm{en})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{Cl}\right]^{+}$, aquachlorobis(ethylenediamine)cobalt(III) ion. The complex has a +1 charge

## Concentrations, pH, Acids, Bases and Redox Answers at end

1. If 10.0 mL of 0.100 M HCl is titrated with 0.200 M NaOH , what volume of sodium hydroxide solution is required to neutralize the acid?

$$
\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

2. If 20.0 mL of 0.500 M KOH is titrated with $0.250 \mathrm{M} \mathrm{HNO}_{3}$, what volume of nitric acid is required to neutralize the base?

$$
\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{KOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{KNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

3. If 25.0 mL of 0.100 M HCl is titrated with $0.150 \mathrm{MBa}(\mathrm{OH})_{2}$, what volume of barium hydroxide is required to neutralize the acid?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{BaCl}_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

4. If 25.0 mL of $0.100 \mathrm{MCa}(\mathrm{OH})_{2}$ is titrated with $0.200 M \mathrm{HNO}_{3}$, what volume of nitric acid is required to neutralize the base?

$$
2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad 2 \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

5. If 20.0 mL of $0.200 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ is titrated with 0.100 M NaOH , what volume of sodium hydroxide is required to neutralize the acid?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

6. If 30.0 mL of $0.100 \mathrm{M} \mathrm{Ca}(\mathrm{OH})_{2}$ is titrated with $0.150 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$, what volume of acetic acid is required to neutralize the base?

$$
2 \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{Ca}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

7. If a 50.0 mL sample of ammonium hydroxide is titrated with 25.0 mL of 0.200 M nitric acid to a methyl red endpoint, what is the molarity of the base?

$$
\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \quad \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

8. If a 50.0 mL sample of ammonium hydroxide is titrated with 25.0 mL of 0.200 M sulfuric acid to a methyl red endpoint, what is the molarity of the base?

$$
2 \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \quad \rightarrow \quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

9. If a 25.0 mL sample of sulfuric acid is titrated with 50.0 mL of 0.200 M potassium hydroxide to a phenolphthalein endpoint, what is the molarity of the acid?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{KOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

10. What is the molarity of a hydrochloric acid solution if 20.00 mL of HCl is required to neutralize 0.424 g of sodium carbonate $(105.99 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

11. What is the molarity of a nitric acid solution if 25.00 mL of $\mathrm{HNO}_{3}$ is required to neutralize 0.424 g of sodium carbonate $(105.99 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

12. What is the molarity of a sulfuric acid solution if 30.00 mL of $\mathrm{H}_{2} \mathrm{SO}_{4}$ is required to neutralize 0.840 g of sodium hydrogen carbonate $(84.01 \mathrm{~g} / \mathrm{mol})$ ?
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaHCO}_{3}(\mathrm{aq}) \rightarrow \quad \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{CO}_{2}(\mathrm{~g})$
13. What is the molarity of a hydrochloric acid solution if 25.00 mL of HCl is required to neutralize 0.500 g of calcium carbonate $(100.09 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{CaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

14. What is the molarity of a sodium hydroxide solution if 40.00 mL of NaOH is required to neutralize 0.900 g of oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4},(90.04 \mathrm{~g} / \mathrm{mol})$ ?

$$
\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

15. What is the molarity of a sodium hydroxide solution if 35.00 mL of NaOH is required to neutralize 1.555 g of KHP , that is $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(204.23 \mathrm{~g} / \mathrm{mol})$ ?

$$
\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{KNaC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

16. If a 0.200 g sample of sodium hydroxide $(40.00 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with $0.100 \mathrm{M}_{2} \mathrm{SO}_{4}$, what volume of sulfuric acid is required?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

17. If 0.900 g of oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4},(90.04 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with 0.300 M NaOH , what volume of sodium hydroxide is required?

$$
\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \rightarrow \quad \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

18. If 1.020 g of $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(204.23 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with 0.200 M $\mathrm{Ba}(\mathrm{OH})_{2}$, what volume of barium hydroxide is required?

$$
2 \mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq}) \rightarrow \mathrm{BaK}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

19. Glycine is an amino acid that can be abbreviated HGly. If 27.50 mL of 0.120 M NaOH neutralizes 0.248 g of HGly, what is the molar mass of the amino acid?

$$
\mathrm{HGly}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaGly}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

20. Proline is an amino acid that can be abbreviated HPro. If 33.55 mL of 0.150 M NaOH neutralizes 0.579 g of HPro, what is the molar mass of the amino acid?

$$
\mathrm{HPro}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \mathrm{NaPro}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

21. Lactic acid is found in sour milk and can be abbreviated HLac. If 47.50 mL of 0.275 $M \mathrm{NaOH}$ neutralizes 1.180 g of HLac, what is the molar mass of the acid?

$$
\mathrm{HLac}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaLac}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

22. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=5.5 \times 10^{-3} M$ ?
23. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=4.2 \times 10^{-5} \mathrm{M}$ ?
24. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=7 / 5 \times 10^{-8} M$ ?
25. What is the $\left[\mathrm{H}^{+}\right]$in an acid rain sample that has a $\mathrm{pH}=3.22$ ?
26. What is the $\left[\mathrm{H}^{+}\right]$in a blood sample that has a $\mathrm{pH}=7.30$ ?
27. What is the $\left[\mathrm{H}^{+}\right]$in a bleach sample that has a $\mathrm{pH}=9.55$ ?
28. What is the $\left[\mathrm{OH}^{-}\right]$in a seawater sample that has a $\mathrm{pH}=8.65$ ?
29. What is the $\left[\mathrm{OH}^{-}\right]$in an ammonia solution that has a $\mathrm{pH}=10.20$ ?
30. What is the $\left[\mathrm{OH}^{-}\right]$in an oven-cleaning solution that has a $\mathrm{pH}=12.35$ ?
31. What substance is oxidized in the following redox reaction?

$$
\mathrm{Zn}(\mathrm{~s})+\mathrm{Cu}^{2+}(\mathrm{aq}) \quad \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s})
$$

32. What substance is reduced in the following redox reaction?

$$
\mathrm{Co}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \quad \rightarrow \mathrm{CoCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

33. What substance is oxidized in the following redox reaction?

$$
\mathrm{F}_{2}(\mathrm{~g})+2 \mathrm{Br}^{-}(\mathrm{aq}) \rightarrow 2 \mathrm{~F}^{-}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{l})
$$

34. What substance is oxidized in the following redox reaction?

$$
\mathrm{HgCl}_{2}(\mathrm{aq})+\mathrm{Sn}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Sn}^{4+}(\mathrm{aq})+\mathrm{Hg}_{2} \mathrm{Cl}_{2}(\mathrm{~s})+\mathrm{Cl}^{-}(\mathrm{aq})
$$

35. What substance is reduced in the following redox reaction?

$$
\mathrm{H}^{+}(\mathrm{aq})+\mathrm{Fe}(\mathrm{~s})+\mathrm{NO}_{3}^{-}(\mathrm{aq}) \rightarrow \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{NO}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

## Acids, Bases, pH, and Redox - Answers

1. If 10.0 mL of 0.100 M HCl is titrated with 0.200 M NaOH , what volume of sodium hydroxide solution is required to neutralize the acid?

$$
\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.100 \mathrm{M})(0.010 \mathrm{~L})=(0.200 \mathrm{M})\left(\mathrm{V}_{2}\right) \mathrm{V}_{2}=0.005 \mathrm{~L}=\mathbf{5} \mathbf{m L}$
2. If 20.0 mL of 0.500 M KOH is titrated with $0.250 \mathrm{M} \mathrm{HO}_{3}$, what volume of nitric acid is required to neutralize the base?

$$
\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{KOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{KNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.500 \mathrm{M})(0.020 \mathrm{~L})=(0.250 \mathrm{M})\left(\mathrm{V}_{2}\right) \mathrm{V}_{2}=0.040 \mathrm{~L}=\mathbf{4 0} \mathbf{m L}$
3. If 25.0 mL of 0.100 M HCl is titrated with $0.150 \mathrm{M} \mathrm{Ba}(\mathrm{OH})_{2}$, what volume of barium hydroxide is required to neutralize the acid?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{BaCl}_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.100 \mathrm{M})(0.025 \mathrm{~L})=(0.150 \mathrm{M})\left(\mathrm{V}_{2}\right) \mathrm{V}_{2}=0.0166 \mathrm{~L}=16.6 \mathrm{~mL} \mathrm{OH}^{-}$
But there are 2 OH 's per $\mathrm{Ba}(\mathrm{OH})_{2}$ so it takes half this volume $=\mathbf{8 . 3 3} \mathbf{~ m L}$ of $\mathbf{B a}(\mathbf{O H})_{2}$
4. If 25.0 mL of $0.100 \mathrm{MCa}(\mathrm{OH})_{2}$ is titrated with $0.200 \mathrm{M} \mathrm{HNO}_{3}$, what volume of nitric acid is required to neutralize the base?

$$
2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad 2 \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.100 \mathrm{M})(0.025 \mathrm{~L})=(0.200 \mathrm{M})\left(\mathrm{V}_{2}\right) \mathrm{V}_{2}=0.0125 \mathrm{~L}=12.5 \mathrm{mLH}+$
But it takes $2 \mathrm{HNO}_{3}$ 's per $\mathrm{Ca}(\mathrm{OH})_{2}$ so it takes twice this volume $=\mathbf{2 5} \mathbf{~ m L}$ of $\mathbf{H N O}_{3}$
5. If 20.0 mL of $0.200 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ is titrated with 0.100 M NaOH , what volume of sodium hydroxide is required to neutralize the acid?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.200 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}=0.400 \mathrm{M} \mathrm{H}^{+}$
$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.40 \mathrm{M})(0.020 \mathrm{~L})=(0.100 \mathrm{M})\left(\mathrm{V}_{2}\right) \quad \mathrm{V}_{2}=0.080 \mathrm{~L}=\mathbf{8 0} \mathbf{~ m L ~ N a O H}$
6. If 30.0 mL of $0.100 \mathrm{MCa}(\mathrm{OH})_{2}$ is titrated with $0.150 M \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$, what volume of acetic acid is required to neutralize the base?

$$
2 \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{Ca}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.100 \mathrm{M} \mathrm{Ca}(\mathrm{OH})_{2}=0.200 \mathrm{M} \mathrm{OH}^{-}$
$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.200 \mathrm{M})(0.030 \mathrm{~L})=(0.150 \mathrm{M})\left(\mathrm{V}_{2}\right) \quad \mathrm{V}_{2}=0.040 \mathrm{~L}=\mathbf{4 0} \mathbf{m L ~ N a O H}$
7. If a 50.0 mL sample of ammonium hydroxide is titrated with 25.0 mL of 0.200 M nitric acid to a methyl red endpoint, what is the molarity of the base?

$$
\begin{aligned}
\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{HNO}_{3}(\mathrm{aq}) & \rightarrow \quad \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.200 \mathrm{M})(0.025 \mathrm{~L}) & =\left(\mathrm{M}_{2}\right)(0.050 \mathrm{~L}) \quad \mathrm{M}_{2}=0.100 \mathrm{MNH}_{4} \mathrm{OH}
\end{aligned}
$$

8. If a 50.0 mL sample of ammonium hydroxide is titrated with 25.0 mL of 0.200 M sulfuric acid to a methyl red endpoint, what is the molarity of the base?

$$
2 \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \quad \rightarrow \quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.200 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}=0.400 \mathrm{M} \mathrm{H}^{+}$
$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.400 \mathrm{M})(0.025 \mathrm{~L})=\left(\mathrm{M}_{2}\right)(0.050 \mathrm{~L}) \quad \mathrm{M}_{2}=\mathbf{0 . 2 0 0} \mathbf{~ M ~ N H} 4 \mathbf{O H}$
9. If a 25.0 mL sample of sulfuric acid is titrated with 50.0 mL of 0.200 M potassium hydroxide to a phenolphthalein endpoint, what is the molarity of the acid?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{KOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{M}_{1} \mathrm{~V}_{1}=\mathrm{M}_{2} \mathrm{~V}_{2} \quad(0.200 \mathrm{M})(0.050 \mathrm{~L})=\left(\mathrm{M}_{2}\right)(0.025 \mathrm{~L}) \mathrm{M}_{2}=0.400 \mathrm{M} \mathrm{H}^{+}$
But, there are 2 H 's per $\mathrm{H}_{2} \mathrm{SO}_{4}$ so $\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]=\mathbf{0 . 2 0 0 M}$
10. What is the molarity of a hydrochloric acid solution if 20.00 mL of HCl is required to neutralize 0.424 g of sodium carbonate $(105.99 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$0.424 \mathrm{~g} / 105.99 \mathrm{~g} / \mathrm{mol}=0.0040 \mathrm{~mol} \mathrm{Na}_{2} \mathrm{CO}_{3}$
Each $\mathrm{Na}_{2} \mathrm{CO}_{3}$ requires 2 HCl so we need 0.0080 mol HCl
$\mathrm{MV}=$ moles $\quad(\mathrm{M})(0.020 \mathrm{~L})=0.0080$ mole $\mathrm{HCl} \quad \mathrm{M}=\mathbf{0 . 4 0} \mathbf{~ M ~ H C l}$
11. What is the molarity of a nitric acid solution if 25.00 mL of $\mathrm{HNO}_{3}$ is required to neutralize 0.424 g of sodium carbonate $(105.99 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$0.424 \mathrm{~g} / 105.99 \mathrm{~g} / \mathrm{mol}=0.0040 \mathrm{~mol} \mathrm{Na}_{2} \mathrm{CO}_{3}$
Each $\mathrm{Na}_{2} \mathrm{CO}_{3}$ requires $2 \mathrm{HNO}_{3}$ so we need $0.0080 \mathrm{~mol}_{\mathrm{HNO}}^{3}$
$\mathrm{MV}=$ moles $\quad(\mathrm{M})(0.025 \mathrm{~L})=0.0080$ mole $\mathrm{HNO}_{3} \quad \mathrm{M}=\mathbf{0 . 3 2} \mathbf{M ~ H N O}_{3}$
12. What is the molarity of a sulfuric acid solution if 30.00 mL of $\mathrm{H}_{2} \mathrm{SO}_{4}$ is required to neutralize 0.840 g of sodium hydrogen carbonate $(84.01 \mathrm{~g} / \mathrm{mol})$ ?
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaHCO}_{3}(\mathrm{aq}) \rightarrow \quad \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{CO}_{2}(\mathrm{~g})$
$0.840 \mathrm{~g} / 84.01 \mathrm{~g} / \mathrm{mol}=0.010 \mathrm{~mol} \mathrm{NaHCO}_{3}$
It takes 2 NaHCO 3 per $\mathrm{H}_{2} \mathrm{SO}_{4}$ so you need $0.005 \mathrm{~mol} \mathrm{H}_{2} \mathrm{SO}_{4}$
$\mathrm{MV}=$ moles $\quad \mathrm{M}(0.030 \mathrm{~L})=0.005$ moles $\quad \mathrm{M}=\mathbf{0 . 1 6 7} \mathbf{M ~ H}_{\mathbf{2}} \mathbf{S O}_{4}$
13. What is the molarity of a hydrochloric acid solution if 25.00 mL of HCl is required to neutralize 0.500 g of calcium carbonate $(100.09 \mathrm{~g} / \mathrm{mol})$ ?

$$
2 \mathrm{HCl}(\mathrm{aq})+\mathrm{CaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$0.500 \mathrm{~g} / 100.09 \mathrm{~g} / \mathrm{mol}=0.005 \mathrm{~mol} \mathrm{CaCO}_{3}$
Each mole of CaCO 3 requires 2 mol HCl so you need $0.005 \times 2=0.010 \mathrm{~mol} \mathrm{HCl}$
$\mathrm{MV}=$ moles $\quad \mathrm{M}(0.025 \mathrm{~L})=0.010 \mathrm{~mol} \quad \mathrm{M}=\mathbf{0 . 4 0} \mathbf{~ M ~ H C l}$
14. What is the molarity of a sodium hydroxide solution if 40.00 mL of NaOH is required to neutralize 0.900 g of oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4},(90.04 \mathrm{~g} / \mathrm{mol})$ ?

$$
\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq}) \quad+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.900 \mathrm{~g} / 90.04 \mathrm{~g} / \mathrm{mol}=0.010 \mathrm{~mol}$ Oxalic acid
It takes 2 mole NaOH for every mole of Oxalic acid
so you need $2 \times 0.010 \mathrm{~mol}=0.02 \mathrm{~mol} \mathrm{NaOH}$
$\mathrm{MV}=$ moles $\quad \mathrm{M}(0.040 \mathrm{~L})=0.020$ mole $\mathrm{NaOH} \quad \mathbf{M}=\mathbf{0 . 5 0} \mathbf{~ M ~ N a O H}$
15. What is the molarity of a sodium hydroxide solution if 35.00 mL of NaOH is required to neutralize 1.555 g of KHP , that is $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(204.23 \mathrm{~g} / \mathrm{mol})$ ?

$$
\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{KNaC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$1.555 \mathrm{~g} / 204.23 \mathrm{~g} / \mathrm{mol}=0.00761 \mathrm{~mol} \mathrm{KHP}$
1 mole KHP needs 1 mole of NaOH so, 0.00761 mole $\mathrm{KHP}=0.00761$ mole NaOH 0.00761
mole $\mathrm{NaOH} / 0.0351 \mathrm{~L}=\mathbf{0 . 2 1 7 5} \mathbf{~ M ~ N a O H}$
16. If a 0.200 g sample of sodium hydroxide $(40.00 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with $0.100 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$, what volume of sulfuric acid is required?

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.200 \mathrm{~g} \mathrm{NaOH} / 40 \mathrm{~g} / \mathrm{mol}=0.005 \mathrm{~mol} \mathrm{NaOH}$
1 mole of $\mathrm{H}_{2} \mathrm{SO}_{4}$ needs 2 mole NaOH so 0.005 mole NaOH needs 0.0025 mole $\mathrm{H}_{2} \mathrm{SO}_{4}$
$\mathrm{MV}=$ moles $\quad\left(0.100 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}\right)(\mathrm{V})=0.0025$ mole $\quad \mathrm{V}=0.0250 \mathrm{~L}=\mathbf{2 5} \mathbf{~ m L}$
17. If 0.900 g of oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4},(90.04 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with 0.300 M NaOH , what volume of sodium hydroxide is required? $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})$

$$
+2 \mathrm{NaOH}(\mathrm{aq}) \rightarrow \quad \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$0.900 \mathrm{~g} / 90.04 \mathrm{~g} / \mathrm{mol}=0.010 \mathrm{~mol}$ Oxalic acid
It takes 2 mole NaOH for every mole of Oxalic acid
so you need $2 \times 0.010 \mathrm{~mol}=0.02 \mathrm{~mol} \mathrm{NaOH}$
$\mathrm{MV}=$ moles $\quad(0.300 \mathrm{M})(\mathrm{V})=0.020$ mole $\mathrm{NaOH} \quad \mathrm{V}=0.0666 \mathrm{~L}=\mathbf{6 6 . 6} \mathbf{~ m L}$
18. If 1.020 g of $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(204.23 \mathrm{~g} / \mathrm{mol})$ is completely neutralized with 0.200 M $\mathrm{Ba}(\mathrm{OH})_{2}$, what volume of barium hydroxide is required?

$$
2 \mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}(\mathrm{aq})+\mathrm{Ba}(\mathrm{OH})_{2}(\mathrm{aq}) \rightarrow \quad \mathrm{BaK}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$1.020 \mathrm{~g} / 204.23 \mathrm{~g} / \mathrm{mol}=0.0050 \mathrm{~mol}$ KHP
2 mole KHP needs 1 mole of $\mathrm{Ba}(\mathrm{OH})_{2}$ so, 0.0050 mole KHP needs 0.0025 mole $\mathrm{Ba}(\mathrm{OH})_{2}$

$$
\mathrm{MV}=\text { moles } \quad(0.200 \mathrm{M})(\mathrm{V})=0.0025 \text { mole Ba }(\mathrm{OH})_{2} \quad \mathrm{~V}=0.01250 \mathrm{~L}=\mathbf{1 2 . 5} \mathbf{~ m L}
$$

19. Glycine is an amino acid that can be abbreviated HGly. If 27.50 mL of 0.120 M NaOH neutralizes 0.248 g of HGly, what is the molar mass of the amino acid?

$$
\begin{aligned}
& \mathrm{HGly}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaGly}(\mathrm{aq})+ \\
& \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

$\mathrm{MV}=$ moles $\quad(0.120 \mathrm{M})(0.02750 \mathrm{~L})=0.033$ mole $\mathrm{NaOH}=0.0033$ mole HGly
$0.248 \mathrm{~g} / 0.0033$ mole HGly $=75.12 \mathrm{~g} / \mathrm{mol} \mathrm{HGly}$
20. Proline is an amino acid that can be abbreviated HPro. If 33.55 mL of 0.150 M NaOH neutralizes 0.579 g of HPro, what is the molar mass of the amino acid?

$$
\mathrm{HPro}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \mathrm{NaPro(aq)}+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{MV}=$ moles $\quad(0.150 \mathrm{M})(0.03355 \mathrm{~L})=0.005033$ mole $\mathrm{NaOH}=0.005033$ mole HPro $0.579 \mathrm{~g} / 0.050033$ mole HPro $=\mathbf{1 1 5 . 0 5} \mathbf{~} / \mathbf{m o l}$ HPro
21. Lactic acid is found in sour milk and can be abbreviated HLac. If 47.50 mL of 0.275
$M \mathrm{NaOH}$ neutralizes 1.180 g of HLac, what is the molar mass of the acid?

$$
\mathrm{HLac}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{NaLac}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$\mathrm{MV}=$ moles $\quad(0.275 \mathrm{M})(0.0475 \mathrm{~L})=0.01306$ mole $\mathrm{NaOH}=0.01306$ mole HLac

## $1.180 \mathrm{~g} / 0.01306$ mole HLac $=\mathbf{9 0 . 3 3} \mathbf{g} / \mathbf{m o l}$ HLac

22. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=5.5 \times 10^{-3}$
$M ? \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] \quad \mathrm{pH}=-\log \left[5.5 \times 10^{-3}\right]=\mathbf{2 . 2 6}$
23. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=4.2 \times 10^{-5}$
$M ? \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] \quad \mathrm{pH}=-\log \left[4.2 \times 10^{-5}\right]=4.38$
24. What is the pH of an aqueous solution if the $\left[\mathrm{H}^{+}\right]=7.5 \times 10^{-8}$
$M ? \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] \quad \mathrm{pH}=-\log \left[7.5 \times 10^{-8}\right]=7.12$
25. What is the $\left[\mathrm{H}^{+}\right]$in a blood sample that has a $\mathrm{pH}=3.22$ ?
$[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-3.22} \quad[\mathrm{H}+]=\mathbf{6 . 0 3} \times 10^{-4} \mathbf{M}$
26. What is the $[\mathrm{H}+]$ in a blood sample that has a $\mathrm{pH}=7.30$ ?

$$
[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-7.30} \quad[\mathrm{H}+]=\mathbf{5 . 0 1} \mathbf{x 1 0} \mathbf{0}^{-\mathbf{8}} \mathbf{M}
$$

25. What is the $\left[\mathrm{H}^{+}\right]$in a bleach sample that has a $\mathrm{pH}=9.55$ ?

$$
[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-9.55} \quad[\mathrm{H}+]=\mathbf{2 . 8 2} \mathbf{x 1 0} \mathbf{1 0}^{-\mathbf{1 0}} \mathbf{M}
$$

26. What is the $\left[\mathrm{OH}^{-}\right]$in a seawater sample that has a $\mathrm{pH}=8.65$ ?

$$
\begin{aligned}
& {[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-8.65} \quad[\mathrm{H}+]=2.24 \times 10^{-9} \mathrm{M}} \\
& {[\mathrm{H}+][\mathrm{OH}-]=1 \times 10^{-14} \quad\left[2.24 \times 10^{-9} \mathrm{M}\right][\mathrm{OH}-]=1 \times 10^{-14} \quad[\mathrm{OH}-]=\mathbf{4 . 4 6 \times 1 0 ^ { - 9 }} \mathbf{~ M}}
\end{aligned}
$$

27. What is the $\left[\mathrm{OH}^{-}\right]$in an ammonia solution that has a $\mathrm{pH}=10.20$ ?

$$
\begin{aligned}
& {[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-10.20} \quad[\mathrm{H}+]=6.31 \times 10^{-11} \mathrm{M}} \\
& {[\mathrm{H}+][\mathrm{OH}-]=1 \times 10^{-14} \quad\left[6.31 \times 10^{-11} \mathrm{M}\right][\mathrm{OH}-]=1 \times 10^{-14} \quad[\mathrm{OH}-]=\mathbf{1 . 5 8} \times 10^{-4} \mathbf{M}}
\end{aligned}
$$

28. What is the $\left[\mathrm{OH}^{-}\right]$in an oven-cleaning solution that has a $\mathrm{pH}=12.35$ ?

$$
\begin{aligned}
& {[\mathrm{H}+]=10^{-\mathrm{pH}} \quad[\mathrm{H}+]=10^{-12.35} \quad[\mathrm{H}+]=4.47 \times 10^{-13} \mathrm{M}} \\
& {[\mathrm{H}+][\mathrm{OH}-]=1 \times 10^{-14} \quad\left[4.47 \times 10^{-13} \mathrm{M}\right][\mathrm{OH}-]=1 \times 10^{-14} \quad[\mathrm{OH}-]=\mathbf{0 . 0 2 2 4} \mathbf{~ M}}
\end{aligned}
$$

29. What substance is oxidized in the following redox reaction?

$$
\underline{Z n}(\mathrm{~s})+\mathrm{Cu}^{2+}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s})
$$

30. What substance is reduced in the following redox

$$
\text { reaction? } \mathrm{Co}(\mathrm{~s})+2 \underline{\boldsymbol{H} C l}(\mathrm{aq}) \quad \rightarrow \quad \mathrm{CoCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

31. What substance is oxidized in the following redox reaction?

$$
\mathrm{F}_{2}(\mathrm{~g})+2 \underline{\boldsymbol{B r}^{-}}(\mathrm{aq}) \rightarrow 2 \mathrm{~F}^{-}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{l})
$$

32. What substance is oxidized in the following redox reaction?

$$
\mathrm{HgCl}_{2}(\mathrm{aq})+\underline{\boldsymbol{S n}^{2+}(\mathrm{aq})} \rightarrow \mathrm{Sn}^{4+}(\mathrm{aq})+\mathrm{Hg}_{2} \mathrm{Cl}_{2}(\mathrm{~s})+\mathrm{Cl}^{-}(\mathrm{aq})
$$

33. What substance is reduced in the following redox reaction?

$$
\mathrm{H}^{+}(\mathrm{aq})+\mathrm{Fe}(\mathrm{~s})+\underline{N O}_{3}{ }^{-}(\mathrm{aq}) \rightarrow \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{NO}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

## Sample Chemistry Question (Ch. 15, 16, 17) - CH 223

## Questions for Chapters Seventeen Part II, Nineteen and Twenty:

1. What is the concentration of $\mathrm{F}^{-}$in a saturated solution of $\mathrm{BaF}_{2}$ if $\mathrm{K}_{\mathrm{sp}}=1.7^{*} 10^{-6}$ ?
a. $7.5^{*} 10^{-3} \mathrm{M}$
b. $8.2^{*} 10^{-4} \mathrm{M}$
c. $1.5^{*} 10^{-2} \mathrm{M}$
d. $4.3^{*} 10^{-7} \mathrm{M}$
e. $1.5 * 10^{-6} \mathrm{M}$
2. For $\mathrm{BaSO}_{4}, \mathrm{~K}_{\text {sp }}=1.1 * 10^{-10}$. What is the molar solubility of $\mathrm{BaSO}_{4}$ in a solution which is $0.018 \mathrm{M} \mathrm{in}_{2} \mathrm{Na}_{2} \mathrm{SO}_{4}$ ?
a. 0.018 M
b. $7.8^{*} 10^{-5} \mathrm{M}$
c. $1.1 * 10^{-5} \mathrm{M}$
d. $6.1 * 10^{-9} \mathrm{M}$
e. $1.1 * 10^{-10} \mathrm{M}$
3. In which of the following reactions do you expect to have the largest increase in entropy?
a. $\mathrm{I}_{2(\mathrm{~s})} \rightarrow \mathrm{I}_{2(\mathrm{~g})}$
b. $2 \mathrm{IF}_{(\mathrm{g})} \rightarrow \mathrm{I}_{2(\mathrm{~g})}+\mathrm{F}_{2(\mathrm{~g})}$
c. $\mathrm{Mn}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow \mathrm{MnO}_{2(\mathrm{~s})}$
d. $\mathrm{Hg}_{(\mathrm{l})}+\mathrm{S}_{(\mathrm{s})} \rightarrow \mathrm{HgS}_{(\mathrm{s})}$
e. $\mathrm{CuSO}_{4(\mathrm{~s})}+5 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightarrow \mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{s})}$
4. For a particular reaction the equilibrium constant is $1.50 * 10^{-2}$ at $370^{\circ} \mathrm{C} . \Delta \mathrm{H}^{\circ}$ is +16.0 kJ . What is $\Delta \mathrm{S}^{\circ}$ for the reaction?
a. $-18.8 \mathrm{~J} / \mathrm{K}$
b. $+18.8 \mathrm{~J} / \mathrm{K}$
c. $-10.0 \mathrm{~J} / \mathrm{K}$
d. $+10.0 \mathrm{~J} / \mathrm{K}$
e. None of the above
5. How many electrons are transferred in the following reaction:

$$
2 \mathrm{ClO}_{3}^{-}+12 \mathrm{H}^{+}+10 \mathrm{I}^{-} \rightarrow 5 \mathrm{I}_{2}+\mathrm{Cl}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

a. 12
b. 5
c. 2
d. 30
e. 10
6. If a current of 6.0 amps is passed through a solution of $\mathrm{Ag}^{+}{ }_{(\text {aq })}$ for 1.5 hours, how many grams of silver are produced?
a. 0.60 g
b. 36 g
c. 0.34 g
d. 3.0 g
e. 1.0 g

## Here are the answers to the previous questions:

1. What is the concentration of $\mathrm{F}^{-}$in a saturated solution of $\mathrm{BaF}_{2}$ if $\mathrm{K}_{\mathrm{sp}}=1.7^{*} 10^{-6}$ ?
a. $7.5 * 10^{-3} \mathrm{M}$
b. $8.2 * 10^{-4} \mathrm{M}$
c. $1.5 * 10^{-2} \mathrm{M}$
d. $4.3 * 10^{-7} \mathrm{M}$
e. $1.5^{*} 10^{-6} \mathrm{M}$

Answer: Recall that the $\mathrm{K}_{\mathrm{sp}}$ expression can be written as $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{F}^{-}\right]^{2}$ for $\mathrm{BaF}_{2}$. One mole of $\mathrm{BaF}_{2}$ creates two moles of $\mathrm{F}^{-}$and one mole of $\mathrm{Ba}^{2+}$ per mol of $\mathrm{BaF}_{2}$ dissolved. If x represents the amount of $\mathrm{Ba}^{2+}$ dissolved, then 2 x represents the $\mathrm{F}^{-}$, and we can re-write the $\mathrm{K}_{\text {sp }}$ expression as $\mathrm{K}_{\text {sp }}=1.7^{*} 10^{-6}=(\mathrm{x})(2 \mathrm{x})^{2}=(\mathrm{x})\left(4 \mathrm{x}^{2}\right)=4 \mathrm{x}^{3} . \mathrm{x}$ represents the solubility of the $\mathrm{BaF}_{2}$, and here $\mathrm{x}=\left(1.7 * 10^{-6} / 4\right)^{1 / 3}=7.5^{*} 10^{-3} \mathrm{M}$. The concentration of [ $\mathrm{F}^{-}$] will be twice as much as the solubility (since there are two $\mathrm{F}^{-}$ions per $\mathrm{BaF}_{2}$ molecule); hence, the concentration of $\mathrm{F}^{-}$in a saturated $\mathrm{BaF}_{2}$ solution will be $2\left(7.5^{*} 10^{-3} \mathrm{M}\right)=\mathbf{1 . 5} * \mathbf{1 0}^{-\mathbf{2}} \mathbf{M}$, answer $\mathbf{c}$.
2. For $\mathrm{BaSO}_{4}, \mathrm{~K}_{\text {sp }}=1.1 * 10^{-10}$. What is the molar solubility of $\mathrm{BaSO}_{4}$ in a solution which is $0.018 \mathrm{M} \mathrm{in}^{2} \mathrm{Na}_{2} \mathrm{SO}_{4}$ ?
a. 0.018 M
b. $7.8 * 10^{-5} \mathrm{M}$
c. $1.1 * 10^{-5} \mathrm{M}$
d. $6.1 * 10^{-9} \mathrm{M}$
e. $1.1 * 10^{-10} \mathrm{M}$

Answer: If we have a $0.018 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ solution, we have, therefore, a solution with [ $\left.\mathrm{SO}_{4}{ }^{2-}\right]=0.018 \mathrm{M}$ and $\left[\mathrm{Na}^{+}\right]$ $=0.036 \mathrm{M}$.
$\mathrm{K}_{\mathrm{sp}}$ for $\mathrm{BaSO}_{4}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$, and normally we would write $\mathrm{K}_{\mathrm{sp}}=\mathrm{x}^{*} \mathrm{x}$ since both ions dissociate in a 1:1 ratio. $x$ here is the solubility of the $\mathrm{BaSO}_{4}$.

Here, however, we have a common ion present - namely sulfate. We can re-write the equation for $\mathrm{K}_{\text {sp }}$ as following:
$\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]=(\mathrm{x})(\mathrm{x}+0.018)$ since the sulfate has contributions from both the $\mathrm{BaSO}_{4}$ and the $\mathrm{Na}_{2} \mathrm{SO}_{4}$.
Normally x is much smaller than 0.018 , and ( $\mathrm{x}+0.018$ ) will likely be approximately equal to 0.018 using significant figures. We can re-write the equation as:
$\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]=(\mathrm{x})(\mathrm{x}+0.018)=(\mathrm{x})(0.018)$
Solving for x gives the solubility: $\mathrm{x}=\mathrm{K}_{\mathrm{sp}} / 0.018=1.1 * 10^{-10} / 0.018=6.1 * 10^{-9}$
Note that x is much less than 0.018 , making the assumption valid. Answer $=\mathbf{6 . 1} \mathbf{1 0}^{-9}$, answer $\mathbf{d}$.
3. In which of the following reactions do you expect to have the largest increase in entropy?
a. $\mathrm{I}_{\mathrm{s}(\mathrm{s})} \rightarrow \mathrm{I}_{2(\mathrm{~g})}$
b. $2 \mathrm{IF}_{(\mathrm{g})} \rightarrow \mathrm{I}_{2(\mathrm{~g})}+\mathrm{F}_{2(\mathrm{~g})}$
c. $\mathrm{Mn}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow \mathrm{MnO}_{2(\mathrm{~s})}$
d. $\mathrm{Hg}_{(\mathrm{l})}+\mathrm{S}_{(\mathrm{s})} \rightarrow \mathrm{HgS}_{(\mathrm{s})}$
e. $\mathrm{CuSO}_{4(\mathrm{~s})}+5 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightarrow \mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{s})}$

Answer: Entropy will increase upon an increase in disorder. This can occur through several methods, including solids going to liquids and/or liquids going to gases. Another disorder enhancement comes about when a large molecule splits into many particles.

Option a shows a solid going to a gas. This would increase disorder; hence, this would increase the entropy.
Option b shows two gas molecules rearranging to make two more gas molecules. There is no disorder here except possibly in the fact that a mixed molecule (IF) is dissociating to "pure" elements ( $\mathrm{I}_{2}$ and $\mathrm{F}_{2}$ ), which might lead to a decrease in entropy (less randomness in the elements than in the molecules.) Hence, this option will probably lead to a decrease in entropy instead of an increase.

Option c has a solid and gas combining to make a solid. Anytime gases become solids there is usually a decrease in entropy, not an increase. Also, two molecules are changing into one product: this is less disorder, and a lowering of entropy.

Option d is similar to option c except that a liquid is being forced to become a solid. This will also lead to a decrease in entropy. Also, two molecules are changing into one product: this is less disorder, and a lowering of entropy.

Option e is similar to option $d$ in that a liquid is being turned into a solid. Note also how six reactant molecules are converting to one product molecule: this is a more ordered product state, which defeats entropy. Entropy will diminish here.

The only option which should increase the entropy is option a, the correct answer for this problem.
4. For a particular reaction the equilibrium constant is $1.50^{*} 10^{-2}$ at $370^{\circ} \mathrm{C} . \Delta \mathrm{H}^{\circ}$ is +16.0 kJ . What is $\Delta \mathrm{S}^{\circ}$ for the reaction?
a. $-18.8 \mathrm{~J} / \mathrm{K}$
b. $+18.8 \mathrm{~J} / \mathrm{K}$
c. $-10.0 \mathrm{~J} / \mathrm{K}$
d. $+10.0 \mathrm{~J} / \mathrm{K}$
e. None of the above

Answer: To solve this problem we need two equations: $\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}$, and $\Delta \mathrm{G}=-\mathrm{RT} \ln \mathrm{K}$. Combining the equations leads to:
$\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}=-\mathrm{RT} \ln \mathrm{K}$, or
$\Delta \mathrm{S}=(\mathrm{RT} \ln \mathrm{K}+\Delta \mathrm{H}) / \mathrm{T}$
Converting ${ }^{\circ} \mathrm{C}$ to K and kJ to J gives:
$\Delta \mathrm{S}=\left((8.314 * 643 \mathrm{~K}) \ln \left(1.50 * 10^{-2}\right)+\left(16.0 * 10^{3} \mathrm{~J}\right)\right) / 643 \mathrm{~K}=\mathbf{- 1 0 . 0} \mathbf{J} / \mathrm{K}$, answer $\mathbf{c}$.
5. How many electrons are transferred in the following reaction:

## $\mathbf{2} \mathbf{C l O}_{3}^{-}+12 \mathbf{H}^{+}+10 \mathrm{I}^{-} \rightarrow 5 \mathrm{I}_{2}+\mathrm{Cl}_{2}+\mathbf{6} \mathrm{H}_{\mathbf{2}} \mathrm{O}$

a. 12
b. 5
c. 2
d. 30
e. 10

Answer: To solve this equation, we need to break the oxidizing and reducing portions into half reactions. Cl in chlorate changes its oxidation number upon going to $\mathrm{Cl}_{2} ; \mathrm{I}^{-}$also changes its oxidation number upon going to $\mathrm{I}_{2}$.

For the Cl :
$12 \mathrm{H}^{+}+2 \mathrm{ClO}_{3}^{-} \rightarrow \mathrm{Cl}_{2}+6 \mathrm{H}_{2} \mathrm{O}$
gives a balanced reaction for mass, but not for charge. The product side has no charge, the reactant side has a net +10 charge; hence, add 10 electrons to the reactant side to balance charge. The result:
$10 \mathrm{e}^{-}+6 \mathrm{H}^{+}+2 \mathrm{ClO}_{3}^{-} \rightarrow \mathrm{Cl}_{2}+3 \mathrm{H}_{2} \mathrm{O}$
For the $I^{-}$side,
$2 \mathrm{I}^{-} \rightarrow \mathrm{I}_{2}$
This equation is balanced for mass, but not charge: the reactant side has a net -2 charge, and the product side has no charge. Add 2 electrons to balance the equation for both mass and charge to get:
$2 \mathrm{I}^{-} \rightarrow \mathrm{I}_{2}+2 \mathrm{e}^{-}$
We can now clearly see that the $\mathrm{I}^{-}$is being oxidized (losing electrons) and the $\mathrm{ClO}_{3}^{-}$is being reduced (gaining electrons.)

To balance the reaction, multiple the $I^{-}$equation by five to cancel the electrons. This results in ten net electrons being transferred from the $\mathrm{I}^{-}$to the $\mathrm{ClO}_{3}{ }^{-}$, meaning that $\mathbf{1 0}$ electrons are being transferred, answer $\mathbf{e}$.
6. If a current of 6.0 amps is passed through a solution of $\mathrm{Ag}^{+}{ }_{\text {(aq) }}$ for 1.5 hours, how many grams of silver are produced?
a. 0.60 g
b. 36 g
c. 0.34 g
d. 3.0 g
e. 1.0 g

Answer: Remember that an amp equals a Coulomb per second. In addition, the Faraday ( $96485 \mathrm{C} / \mathrm{mol} \mathrm{e}$ ) will be helpful, and each $\mathrm{Ag}^{+}$will need one electron to become $\mathrm{Ag}_{(s)}$. Unit analysis will help to solve this problem:
$6.0 \mathrm{amps}=6.0 \mathrm{C} / \mathrm{s} *(60 \mathrm{~s} /$ minute $) *(60$ minutes $/$ hour $) * 1.5$ hours $=32400 \mathrm{C}$ delivered to the $\mathrm{Ag}^{+}$.
To find out the quantity of silver produced, use the Faraday constant and the atomic mass of silver.
$32400 \mathrm{C} *\left(\mathrm{~mol} \mathrm{e}^{-} / 96485 \mathrm{C}\right) *\left(\mathrm{~mol} \mathrm{Ag}^{+} / \mathrm{mol} \mathrm{e}^{-}\right) *(108 \mathrm{~g} \mathrm{Ag} / \mathrm{mol} \mathrm{Ag})=\mathbf{3 6} \mathbf{g}$ of silver, answer $\mathbf{b}$.

## Nomenclature of Coordination Complexes

(Self quiz after overview) Overview: Ligands = attached atoms or molecules

Anion Name
Bromide, $\mathrm{Br}^{-}$
Carbonate, $\mathrm{CO}_{3}{ }^{2}$
Chloride, $\mathrm{Cl}^{-}$
Cyanide, $\mathrm{CN}^{-}$
Fluoride, $\mathrm{F}^{-}$
Hydroxide, $\mathrm{OH}_{2}^{-}$
Oxalate, $\mathrm{C}_{2} \mathrm{O}_{4}$
EDTA

Neutral Ligand
Ammonia, NH3
Water, H2O
Carbon Monoxide, CO
Ethylenediamine, en

Metal
Aluminum
Chromium
Cobalt
Copper
Gold
Iron
Manganese
Nickel
Platinum
Zinc

Ligand Name
Bromo
Carbonato
Chloro
Cyano
Fluoro
Hydroxo
Oxalato
Ethylenediamine tetracetato
Ligand Name
Ammine
Aqua
Carbonyl
Ethylenediamine
Anion Name
Aluminate
Chromate
Cobaltate
Cuprate
Aurate
Ferrate
Manganate
Nickelate
Platinate
Zincate

If more than one ligand is attached then,
$2=\mathrm{di}$
$3=$ tri
4 = tetra
$5=$ penta
$6=$ hexa

If the ligand has di, tri, tetra, in its name or is a dentate molecule, and you want to indicate you have more than one of them then use,

2 = bis
$3=$ tris
$4=$ tetrakis

```
Bidentates - two bites
    Oxalate (ox)
    Ethylenediamine (en)
    Malate (mal)
Tridentate - three bites
    Citrate (cit)
Hexadentate - six bites
    EDTA
```

EDTA wrapped around a metal ion.

## How to name complex ions that are positively charged.

The name of the transition metal comes at the end of the name along with a Roman numeral indicating its charge,

Ex: $\quad \mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}=$ hexamminecobalt(III)
$\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}_{2}\right)_{4}^{2+}=$ hexaquairon(II)

$\mathrm{Cu}(\mathrm{CO})_{4}=$ tetracarbonylcopper(II)
Now, every compound has both a positive part and a negative part, like NaCl is really $\mathrm{Na}^{+}$and $\mathrm{Cl}^{-}$. The same is true for complex ions only the positive and negative parts can be really large and complex (which is why they are called complex ions).

In the above examples I gave several positive ions and their name, but each of them also has a negative part that goes with them. Consider the following compounds,

Ex: $\quad \mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6} \mathrm{Cl}_{3}=$ hexamminecobalt(III) chloride
$\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}(\mathrm{OH})_{2}=$ hexaquairon(II) hydroxide
$\mathrm{Ni}(\mathrm{en})_{2} \mathrm{SO}_{4}=$ bis(ethylenediamine)nickel(II) sulfate
$\mathrm{Cu}(\mathrm{CO})_{4} \mathrm{CO}_{3}=$ tetracarbonylcopper(II) carbonate
In each case an anion has been added to the complex ion. This completes the structure and produces an overall neutral compound that could be stored in a bottle in our storeroom. You will notice that the nomenclature has not changed much from what we learned about transition metal nomenclature, you name the metal ion, indicate its charge with a Roman Numeral, and then add the anion onto the end. Only in this case the positive ion is large and complex but the nomenclature is the same.

## How to name complex ions that are negatively charged

A large number of complex ions are negatively charged. This is caused by having several negatively charged ligands attached to the metal. Consider the following compounds,

Ex: $\quad \mathrm{CoCl}_{6}{ }^{3-}{ }_{3} \mathrm{Co}^{3+}$ with $6 \mathrm{Cl}^{-}$
$\mathrm{Fe}(\mathrm{CN})_{6}=\mathrm{Fe}$ with 6 CN
$\mathrm{Cr}\left(\mathrm{OH}_{2}\right)_{4}^{-}=\mathrm{Cr}_{2+}^{3+}$ with $4 \mathrm{OH}^{-}$
$\mathrm{RhBr}_{4}=\mathrm{Rh}$ with 4 Br
When a complex is negative the name of the metal changes. Generally we use its actual nazme (iron becomes ferrium) and we add an -ate at the end of its name. So $\mathrm{Fe}(\mathrm{CN})_{6}$ becomes hexacyanoferrate(III). Therefore, from the example given above we get the following names;

Ex: $\quad \mathrm{CoCl}_{6}{ }^{3-}{ }_{3}{ }_{3}$ hexachlorocobaltate(III)
$\mathrm{Fe}(\mathrm{CN})_{6}=$ hexacyanoferrate(III)
$\mathrm{Cr}\left(\mathrm{OH}_{2}\right)^{-}=$tetrahydroxochromate(III)
$\mathrm{RhBr}_{4}=$ tetrabromorhodate(II)
Of course, once again, negative ions are never found without a corresponding positive ion. So the compounds above would actually look something like this,

Ex: $\quad \mathrm{Na}_{3} \mathrm{CoCl}_{6}=$ Sodium Hexachlorocobaltate(III)
$\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}=$ Potassium Hexacyanoferrate(III)
$\mathrm{LiCr}(\mathrm{OH})_{4}=$ Lithium Tetrahydroxochromate(III)
$\mathrm{CaRhBr}_{4}=$ Calcium Tetrabromorhodate(II)

## Problems

1) Name the following compounds,
$\mathrm{Cu}(\mathrm{OH})_{4}{ }^{2-}$
$\mathrm{Na}_{3} \mathrm{AuCl}_{4}$
$\mathrm{Mo}(\mathrm{CN})_{6}{ }^{4-}$
$\mathrm{Fe}(\mathrm{CO})_{6} \mathrm{ScCl}_{6}$
$\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right] \mathrm{Cl}_{3}$
$\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Br}_{3}$
$\left[\mathrm{Pt}(\mathrm{en})_{2} \mathrm{Cl}_{2}\right] \mathrm{Cl}_{2}$
$\left[\mathrm{Co}(\mathrm{en})_{3}\right]_{2}\left(\mathrm{SO}_{4}\right)_{3}$
$\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$
$\mathrm{Na}_{2}\left[\mathrm{NiCl}_{4}\right]$
$\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{4}$
$\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Ni}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$
$\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]$
$\left[\mathrm{CoBr}\left(\mathrm{NH}_{3}\right)_{5}\right] \mathrm{SO}_{4}$
$\left[\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{6}\right]\left[\mathrm{Cr}(\mathrm{CN})_{6}\right]$
$\left[\mathrm{Co}\left(\mathrm{SO}_{4}\right)\left(\mathrm{NH}_{3}\right)_{5}\right]^{+}$
$\left[\mathrm{Fe}(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{2+}$
2) Write the formula of the following coordination compounds.
hexaammineiron(III) nitrate
ammonium tetrachlorocuprate(II)
sodium monochloropentacyanoferrate(III)
potassium hexafluorocobaltate(III)
3) Give the number of $d$ electrons for each of the complexes listed below. Are the complexes paramagnetic or diamagnetic?
\# d electrons Paramagnetic or Diamagnetic
$\mathrm{Pd}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}$
$\mathrm{Ru}(\mathrm{CO})_{6}{ }^{3+}$
$\mathrm{Ni}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$
$\mathrm{HgCl}_{4}{ }^{2-}$

## Answer Key

1) Name the following compounds,

| $\mathrm{Cu}(\mathrm{OH})_{4}{ }^{2-}$ | tetrahydoxocuprate(II) |
| :---: | :---: |
| $\mathrm{Na}_{3} \mathrm{AuCl}_{4}$ | Sodium tetrachloroaurate(1) |
| $\mathrm{Mo}(\mathrm{CN})_{6}^{4-}$ | hexacyanomolybdenate(II) |
| $\mathrm{Fe}(\mathrm{CO})_{6} \mathrm{ScCl}_{6}$ | hexacarbonyliron(III) hexachloroscanadate(III) |
| $\left[\mathrm{Cr}\left(\mathrm{NH}_{3}\right)_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right] \mathrm{Cl}_{3}$ | triamminotriaquachromium(III) chloride |
| $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{Cl}\right] \mathrm{Br}_{3}$ | pentaamminochloroplatinum(IV) bromide |
| $\left[\mathrm{Pt}(\mathrm{en}) \mathrm{COL}_{2}\right] \mathrm{Cl}_{2}$ | dichlorobis(ethylenediamine)platinum(II) chloride |
| $\left[\mathrm{Co}(\mathrm{en})_{3}\right]_{2}\left(\mathrm{SO}_{4}\right)_{3}$ | tris(ethylenediamine)cobalt(III) sulfate |
| $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ | Potassium hexacyanoferrate(II) |
| $\mathrm{Na}_{2}\left[\mathrm{NiCl}_{4}\right]$ | Sodium tetrachloronickelate(II) |
| $\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl} 4$ | diamminoplatinum(IV) chloride |
| $\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Ni}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$ | Ammonium diaquabis(oxalate)nickelate(II) |
| $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]$ | diamminosilver(I) dicyanoargentate(I) |
| $\left[\mathrm{CoBr}\left(\mathrm{NH}_{3}\right)_{5}\right] \mathrm{SO}_{4}$ | pentamminobromocobalt(III) sulfate |
| $\left[\mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{6}\right]\left[\mathrm{Cr}(\mathrm{CN})_{6}\right]$ | hexamminoiron(III) hexacyanochromate(III) |
| $\left[\mathrm{Co}\left(\mathrm{SO}_{4}\right)\left(\mathrm{NH}_{3}\right)_{5}\right]^{+}$ | pentamminosulfatocobalt(III) |
| $\left[\mathrm{Fe}(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{2+}$ | pentaaquahydroxoiron(III) |

2) Write the formula of the following coordination compounds.
hexaammineiron(III) nitrate $\quad \mathrm{Fe}\left(\mathrm{NH}_{3}\right)_{6}\left(\mathrm{NO}_{3}\right)_{3}$
ammonium tetrachlorocuprate(II) $\quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CuCl}_{4}$
sodium monochloropentacyanoferrate(III)
potassium hexafluorocobaltate(III) $\quad \mathrm{K}_{3} \mathrm{CoF}_{6}$
3) Give the number of $d$ electrons for each of the complexes listed below. Are the complexes paramagnetic or diamagnetic?

|  | \# d electrons | Paramagnetic or Diamagnetic |
| :--- | :---: | :---: |
| $\mathrm{Pd}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}$ | d 8 | Diamagnetic |
| $\mathrm{Ru}(\mathrm{CO})_{6}{ }^{3+}$ | d 5 | Paramagnetic |
| $\mathrm{Ni}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | d 8 | Paramagnetic |
| $\mathrm{HgCl}_{4}{ }^{2-}$ | d 10 | Diamagnetic |

Sample Quiz \#1 Name: $\qquad$
$\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.

1. For the reaction: $\mathbf{C H}_{\mathbf{4}}(\mathrm{g})+\mathbf{2} \mathbf{O}_{\mathbf{2}}(\mathbf{g}) \rightleftharpoons \mathbf{C O}_{\mathbf{2}}(\mathrm{g})+\mathbf{2} \mathbf{H}_{\mathbf{2}} \mathbf{O}(\mathbf{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 . 1 5 * 1 0}{ }^{\mathbf{7}}(430 . \mathrm{K})$, held within a 2.00 L flask (10 points) Write the equilibrium constant expression for $\mathrm{K}_{\mathrm{c}}$.

Is the reaction at equilibrium if $\left[\mathrm{CO}_{2}\right]=\left[\mathrm{H}_{2} \mathrm{O}\right]=0.00350 \mathrm{M},\left[\mathrm{O}_{2}\right]=3.31 * 10^{-6} \mathrm{M}$ and $\left[\mathrm{CH}_{4}\right]=3.31^{*} 10^{-6} \mathrm{M}$ ? If not, indicate the direction that the reaction must proceed to achieve equilibrium.

What is the value of the equilibrium constant if the reaction is $2 \mathrm{CH}_{4}(\mathrm{~g})+4 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ at $430 . \mathrm{K}$ ?

What is the value of $\mathrm{K}_{\mathrm{c}}$ at 430 . K for the reaction: $\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftharpoons \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g})$
2. For the reaction: $\mathbf{C l}_{\mathbf{2}}(\mathbf{g})+\mathbf{B r}_{\mathbf{2}}(\mathbf{g}) \rightleftharpoons \mathbf{2} \mathbf{B r C l}(\mathbf{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 0 . 3}\left(150^{\circ} \mathrm{C}\right)$ (4 points)

Is this reaction product-favored or reactant-favored?

If 0.500 mol BrCl in a 1.00 L flask is allowed to reach equilibrium, what are the equilibrium concentrations of $\mathrm{Cl}_{2}, \mathrm{Br}_{2}$ and BrCl ?
3. For the reaction: $\mathbf{R X}(\mathbf{s}) \rightleftharpoons \mathbf{R}(\mathbf{g})+\mathbf{X}(\mathbf{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 . 1 1 * 1 0 ^ { - 7 }}$ (200. K) (6 points)

Write the equilibrium constant expression.

Calculate the equilibrium concentrations of R and X if a solid sample of RX is placed in a closed vessel and decomposes until equilibrium is established.

What is the value of $\mathbf{K}_{\mathbf{p}}$ at 200 . K ?
$\qquad$
$\qquad$

1. For the reaction: $\mathbf{C H}_{4}(\mathrm{~g})+\mathbf{2} \mathbf{O}_{\mathbf{2}}(\mathrm{g}) \rightleftharpoons \mathbf{C O}_{\mathbf{2}}(\mathrm{g})+\mathbf{2} \mathbf{H}_{\mathbf{2}} \mathbf{O}(\mathrm{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 . 1 5 * 1 0 ^ { 7 }}$ (430. K), held within a 2.00 L flask (10 points)

Write the equilibrium constant expression for $\mathrm{K}_{\mathrm{c} .} \mathrm{K}_{\mathrm{c}}=\left[\mathrm{H}_{2} \mathbf{O}\right]^{2}\left[\mathrm{CO}_{2}\right] /\left[\mathrm{CH}_{4}\right]\left[\mathrm{O}_{2}\right]^{2}=\mathbf{1 . 1 5 \times 1 0} \mathbf{1 0}^{7}$
Is the reaction at equilibrium if $\left[\mathrm{CO}_{2}\right]=\left[\mathrm{H}_{2} \mathrm{O}\right]=0.00350 \mathrm{M},\left[\mathrm{O}_{2}\right]=3.31 * 10^{-6} \mathrm{M}$ and $\left[\mathrm{CH}_{4}\right]=3.31 * 10^{-6} \mathrm{M}$ ? If not, indicate the direction that the reaction must proceed to achieve equilibrium.
$Q=1.18 \times 10^{9}$
$\mathbf{Q}>\mathbf{K}$, will shift left (to reactant side)
What is the value of the equilibrium constant if the reaction is $2 \mathrm{CH}_{4}(\mathrm{~g})+4 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ at $430 . \mathrm{K}$ ?
$K_{\text {new }}=1.32 \times 10^{14}$
What is the value of $\mathrm{K}_{\mathrm{c}}$ at 430 . K for the reaction: $\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftharpoons \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g})$
$K_{\text {new }}=8.70 \times 10^{-8}$
2. For the reaction: $\mathbf{C l}_{\mathbf{2}}(\mathbf{g})+\mathbf{B r}_{\mathbf{2}}(\mathbf{g}) \rightleftharpoons \mathbf{2} \mathbf{~ B r C l}(\mathbf{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 0 . 3}\left(150^{\circ} \mathrm{C}\right)$ (4 points)

Is this reaction product-favored or reactant-favored? product favored $\left(\mathbf{K}_{\mathbf{c}}>\mathbf{1}\right)$
If 0.500 mol BrCl in a 1.00 L flask is allowed to reach equilibrium, what are the equilibrium concentrations of $\mathrm{Cl}_{2}, \mathrm{Br}_{2}$ and BrCl ?
$\left[\mathrm{Cl}_{2}\right]=\left[\mathrm{Br}_{2}\right]=\mathbf{0 . 0 9 6 0 ~ M}$
$[\mathrm{BrCl}]=0.308 \mathrm{M}$
3. For the reaction: $\mathbf{R X}(\mathbf{s}) \rightleftharpoons \mathbf{R}(\mathbf{g})+\mathbf{X}(\mathbf{g}), \mathbf{K}_{\mathbf{c}}=\mathbf{1 . 1 1 * 1 0} \mathbf{1 0}^{-\mathbf{7}}$ (200. K) (6 points)

Write the equilibrium constant expression. $\quad \mathbf{K}_{\mathbf{c}}=[\mathbf{R}][\mathbf{X}]=\mathbf{1 . 1 1 \times 1 0} \mathbf{1 0}^{-\mathbf{7}}$
Calculate the equilibrium concentrations of R and X if a solid sample of RX is placed in a closed vessel and decomposes until equilibrium is established.
$[\mathrm{R}]=[\mathrm{X}]=\mathbf{3 . 3 3 \times 1 0 ^ { - 4 }} \mathbf{M}$
What is the value of $\mathbf{K}_{\mathbf{p}}$ at 200 . K ?
$K_{p}=2.99 \times 10^{-5}$
$\qquad$
$\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.

1. For the equilibrium $2 \mathbf{C O}_{(\mathrm{g})}+\mathbf{O}_{\mathbf{2}(\mathrm{g})} \rightleftharpoons 2 \mathbf{C O}_{\mathbf{2}(\mathrm{g})}$ where $\Delta \mathbf{H}<0$, how will each of the following affect the equilibrium? Circle the correct answer. (4 points)
a. Oxygen is added to the system. right left no change
b. The reaction mixture is heated. right left no change
c. The pressure of the reaction mixture is increased. right left no change
d. $\mathrm{CO}_{2}$ is removed from the system. right left no change
2. Complete and balance the following acid-base reactions. Identify the acid, base, conjugate acid and conjugate base in each reaction. Predict whether the equilibrium lies predominantly to the left or the right. (6 points)
a. $\mathrm{HBr}+\mathrm{NH}_{3} \rightarrow$
b. $\mathrm{HOCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow$
3. What is the pH of a $0.116 \mathrm{M} \mathrm{Mg}(\mathrm{OH})_{2}$ solution? Assume $\mathrm{Mg}(\mathrm{OH})_{2}$ is a strong base. (3 points)
4. My soft drink has a pH of 6.22 . Is the soft drink acidic, alkaline or neutral? Calculate the hydronium and hydroxide ion concentration in the soft drink. (3 points)
5. Benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$, is a weak acid $\left(\mathrm{K}_{\mathrm{a}}=6.28^{*} 10^{-5}\right)$. If I dissolve 1.22 g of $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$ in enough water to make $500 . \mathrm{mL}$ of solution, what is the resulting pH of the solution? (4 points)
$\qquad$ Lab Section: $\qquad$
6. For the equilibrium $2 \mathbf{C O}_{(\mathrm{g})}+\mathbf{O}_{2(\mathrm{~g})} \rightleftharpoons 2 \mathbf{C O}_{2(\mathrm{~g})}$ where $\Delta \mathrm{H}<\mathbf{0}$, how will each of the following affect the equilibrium? Circle the correct answer. (4 points)
a. Oxygen is added to the system. right left no change
b. The reaction mixture is heated. right left no change
c. The pressure of the reaction mixture is increased. right left no change
d. $\mathrm{CO}_{2}$ is removed from the system. right left no change
7. Complete and balance the following acid-base reactions. Identify the acid, base, conjugate acid and conjugate base in each reaction. Predict whether the equilibrium lies predominantly to the left or the right. (6 points)
a. $\underset{\mathbf{S A}}{\mathrm{HBr}}+\underset{\mathbf{W B}}{\mathrm{NH}_{3}} \rightarrow \underset{\mathbf{C A}}{\mathbf{N H}_{4}{ }^{+}}+\underset{\mathbf{C B}}{\mathbf{B r}^{-1}}$

RIGHT (SA)
b. $\underset{\mathbf{W A}}{\mathrm{HOCl}}+\underset{\mathbf{W B}}{\mathrm{H}_{2} \mathrm{O}} \rightarrow \underset{\mathbf{C B}}{\mathbf{O C l}^{-1}}+\underset{\mathbf{C A}}{\mathbf{H}_{\mathbf{3}} \mathbf{O}^{\mathbf{+ 1}}}$

## LEFT (WA)

3. What is the pH of a $0.116 \mathrm{M} \mathrm{Mg}(\mathrm{OH})_{2}$ solution? Assume $\mathrm{Mg}(\mathrm{OH})_{2}$ is a strong base. (3 points)
```
pH=13.365
```

4. My soft drink has a pH of 6.22. Is the soft drink acidic, alkaline or neutral? Calculate the hydronium and hydroxide ion concentration in the soft drink. (3 points)
```
Acidic!
[H3O}\mp@subsup{O}{}{+}]=6.0\times1\mp@subsup{0}{}{-7}\textrm{M
[OH-1]=1.7 x 10-8 M
```

5. Benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$, is a weak acid $\left(\mathrm{K}_{\mathrm{a}}=6.28^{*} 10^{-5}\right)$. If I dissolve 1.22 g of $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$ in enough water to make 500 mL of solution, what is the resulting pH of the solution? (4 points)
```
pH=2.951
```

Sample Quiz \#3 Name: $\qquad$ Lab Section: $\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.

1) Acetic acid $\left(\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}, 2.00 \mathrm{~g}\right)$ and sodium acetate $\left(\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}, 2.00 \mathrm{~g}\right)$ are dissolved in enough water to make 1.00 L of solution. Calculate the pH of the solution $\left(\mathrm{K}_{\mathrm{a}}=1.80 * 10^{-5}\right)$ (6 points)
2) 50.0 mL of 0.150 M acetic acid is being titrated with 0.250 M LiOH . What is the pH at the half-equivalence point? How many mL of LiOH are required to reach the half equivalence point? $\left(\mathrm{K}_{\mathrm{a}}=1.80 * 10^{-5}\right)(4$ points $)$
3) A solution contains 20.0 mL of $0.150 \mathrm{M} \mathrm{HNO}_{3}$. ( 10 points)
a) What is the pH of the $\mathrm{HNO}_{3}$ solution?
b) What is the pH after 10.0 mL of 0.250 M NaOH has been added?
c) What is the pH at the equivalence point? How many mL of 0.250 M NaOH need to be added to reach the equivalence point?
d) What is the pH after 30.0 mL of 0.250 M NaOH have been added?
$\qquad$
$\qquad$
4) Acetic acid $\left(\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}, 2.00 \mathrm{~g}\right)$ and sodium acetate $\left(\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}, 2.00 \mathrm{~g}\right)$ are dissolved in enough water to make 1.00 L of solution. Calculate the pH of the solution $\left(\mathrm{K}_{\mathrm{a}}=1.80 * 10^{-5}\right)(6$ points $)$
$\mathrm{pH}=4.609$
5) 50.0 mL of 0.150 M acetic acid is being titrated with 0.250 M LiOH . What is the pH at the half-equivalence point? How many mL of LiOH are required to reach the half equivalence point? $\left(\mathrm{K}_{\mathrm{a}}=1.80 * 10^{-5}\right)(4$ points $)$
$\mathrm{pH}=4.745$
$\mathrm{V}(\mathrm{LiOH})=\mathbf{1 5 . 0} \mathbf{~ m L}$
6) A solution contains 20.0 mL of $0.150 \mathrm{M} \mathrm{HNO}_{3}$. ( 10 points)
a) What is the pH of the $\mathrm{HNO}_{3}$ solution?
$\mathrm{pH}=\mathbf{0 . 8 2 4}$
b) What is the pH after 10.0 mL of 0.250 M NaOH has been added?
$\mathrm{pH}=1.78$
c) What is the pH at the equivalence point? How many mL of 0.250 M NaOH need to be added to reach the equivalence point?
pH = 7
$\mathrm{V}(\mathbf{N a O H})=12.0 \mathrm{~mL}$
d) What is the pH after 30.0 mL of 0.250 M NaOH have been added?
$\mathbf{p H}=12.954$

Sample Quiz \#4 Name: $\qquad$ Lab Section: $\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.
Question \#1: 10 points
a. Write the balanced equation for the equilibrium of copper(II) hydroxide, $\mathrm{Cu}(\mathrm{OH})_{2}$, in water and the $\mathrm{K}_{\mathrm{sp}}$ expression. $\mathrm{K}_{\mathrm{sp}}=$ $2.2^{*} 10^{-20}$ at $25^{\circ} \mathrm{C}$.
b. What is the solubility of copper(II) hydroxide at $25^{\circ} \mathrm{C}$ ?
c. What is the solubility of copper(II) hydroxide at $25^{\circ} \mathrm{C}$ if the initial $\left[\mathrm{Cu}^{+2}\right]=0.010 \mathrm{M}$ ?
d. Will a precipitate form when 10.0 mL of 0.0015 M copper(II) nitrate is mixed with $10 . \mathrm{mL}$ of 0.015 M sodium hydroxide?

Question \#2: 4 points
Given the following reactions,

$$
\begin{array}{ll}
\mathrm{AgBr}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq}) & K_{\mathrm{sp}}=5.4 \times 10^{-13} \\
\mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{CN}^{-}(\mathrm{aq}) \rightleftharpoons \operatorname{Ag}(\mathrm{CN})_{2}^{-}(\mathrm{aq}) & K_{\mathrm{f}}=1.2 \times 10^{21}
\end{array}
$$

determine the equilibrium constant for the reaction below.
$\mathrm{AgBr}(\mathrm{s})+2 \mathrm{CN}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Ag}(\mathrm{CN})_{2}^{-}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq})$

## Question \#3: 6 points

a. A solution of $\mathrm{Na}_{2} \mathrm{SO}_{4}$ is added dropwise to a solution that is $0.010 \mathrm{M} \mathrm{Ba}^{2+}$ and $0.010 \mathrm{M} \mathrm{Ag}^{+1}$. Neglecting volume changes, which salt precipitates first, $\mathrm{BaSO}_{4}\left(K_{\mathrm{sp}}=1.1 * 10^{-10}\right)$ or $\mathrm{Ag}_{2} \mathrm{SO}_{4}\left(K_{\mathrm{sp}}=1.7^{*} 10^{-5}\right)$ ?
b. What is the concentration of the cation that precipitates first when the second cation begins to precipitate?
$\qquad$
$\qquad$

Question \#1: 10 points
a. Write the balanced equation for the equilibrium of copper(II) hydroxide, $\mathrm{Cu}(\mathrm{OH})_{2}$, in water and the $\mathrm{K}_{\mathrm{sp}}$ expression. $\mathrm{K}_{\mathrm{sp}}=$ $2.2 * 10^{-20}$ at $25{ }^{\circ} \mathrm{C}$.
$\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathbf{O H}^{-1}(\mathrm{aq})$
$\mathbf{K}_{\text {sp }}=\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{OH}^{-1}\right]^{2}$
b. What is the solubility of copper(II) hydroxide at $25^{\circ} \mathrm{C}$ ?

$$
\mathrm{x}=1.8 \times 10^{-7} \mathrm{M}
$$

c. What is the solubility of copper(II) hydroxide at $25^{\circ} \mathrm{C}$ if the initial $\left[\mathrm{Cu}^{+2}\right]=0.010 \mathrm{M}$ ?

$$
\mathbf{x}=7.5 \times 10^{-10} \mathbf{M}\left(7.4 \times 10^{-10} \mathrm{ok}\right)
$$

d. Will a precipitate form when 10.0 mL of 0.0015 M copper(II) nitrate is mixed with $10 . \mathrm{mL}$ of 0.015 M sodium hydroxide?

## Yes, solid forms

## Question \#2: 4 points

Given the following reactions,

$$
\begin{array}{ll}
\mathrm{AgBr}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq}) & K_{\mathrm{sp}}=5.4 \times 10^{-13} \\
\mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{CN}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Ag}(\mathrm{CN})_{2}^{-}(\mathrm{aq}) & K_{\mathrm{f}}=1.2 \times 10^{21}
\end{array}
$$

determine the equilibrium constant for the reaction below.

$$
\mathrm{AgBr}(\mathrm{~s})+2 \mathrm{CN}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Ag}(\mathrm{CN})_{2}^{-}(\mathrm{aq})+\mathrm{Br}^{-1}(\mathrm{aq})
$$

$$
K_{\text {net }}=6.5 \times 10^{8}
$$

## Question \#3: 6 points

a. A solution of $\mathrm{Na}_{2} \mathrm{SO}_{4}$ is added dropwise to a solution that is $0.010 \mathrm{M} \mathrm{Ba}^{2+}$ and $0.010 \mathrm{M} \mathrm{Ag}^{+1}$. Neglecting volume changes, which salt precipitates first, $\mathrm{BaSO}_{4}\left(K_{\mathrm{sp}}=1.1 * 10^{-10}\right)$ or $\mathrm{Ag}_{2} \mathrm{SO}_{4}\left(K_{\text {sp }}=1.7 * 10^{-5}\right)$ ?

## $\mathrm{BaSO}_{4}$ precipitates first

b. What is the concentration of the cation that precipitates first when the second cation begins to precipitate?

```
6.5 x 10-10}
```

Sample Quiz \#5 Name: $\qquad$ Lab Section: $\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.

Question \#1: (10 points) This reaction was studied at $25.0^{\circ}{ }^{\circ} \mathrm{C}: \mathbf{P}_{\mathbf{4}} \mathbf{O}_{\mathbf{1 0}}(\mathbf{s})+\mathbf{6} \mathbf{H}_{\mathbf{2}} \mathbf{O}(l) \rightarrow \mathbf{4} \mathbf{H}_{\mathbf{3}} \mathbf{P O}_{\mathbf{4}}(l)$
Use the data acquired to calculate values for $\Delta \boldsymbol{H}_{\mathrm{rxx}}^{\circ}, \Delta \boldsymbol{S}_{\mathrm{rxn}}$ and finally $\Delta \boldsymbol{G}_{\mathrm{rxn}}^{\circ}$.

| Species | $\Delta H_{f}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ | $S^{\circ}(\mathrm{J} / \mathrm{K} \cdot \mathrm{mol})$ |
| :--- | :--- | :--- |
| $\mathrm{P}_{4} \mathrm{O}_{10}(\mathrm{~s})$ | -2984.0 | 228.9 |
| $\mathrm{H}_{2} \mathrm{O}(l)$ | -285.8 | 69.95 |
| $\mathrm{H}_{3} \mathrm{PO}_{4}(l)$ | -1279.0 | 110.5 |

Question \#2: (5 points) One kind of battery used in watches contains mercury(II) oxide. As current flows, the mercury(II) oxide is reduced to mercury: $\mathbf{H g O}(s)+\mathbf{H}_{2} \mathrm{O}(l)+2 \mathrm{e}^{-} \rightarrow \mathbf{H g}(l)+\mathbf{2} \mathbf{O H}^{-}(\mathbf{a q})$

If $2.3 \times 10^{-5}$ amperes flows continuously for 1200 days, what mass of $\operatorname{Hg}(l)$ is produced?

Question \#3: ( 5 points) Write a balanced chemical equation for the following reaction in an acidic solution.
$\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+\mathrm{Ni}(\mathrm{s}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{Ni}^{2+}(\mathrm{aq})$

Sample Quiz \#5 Name: $\qquad$ Lab Section: $\qquad$ Answers

Question \#1: (10 points) This reaction was studied at $25.0^{\circ} \mathrm{C}: \mathbf{P}_{4} \mathbf{O}_{\mathbf{1 0}}(\mathbf{s})+\mathbf{6} \mathbf{H}_{\mathbf{2}} \mathbf{O}(\boldsymbol{l}) \rightarrow \mathbf{4} \mathbf{H}_{\mathbf{3}} \mathbf{P O}_{\mathbf{4}}(\boldsymbol{l})$
Use the data acquired to calculate values for $\Delta \boldsymbol{H}^{\circ}{ }_{\mathrm{rxn}}, \Delta \boldsymbol{S}^{\circ}{ }_{\mathrm{rxn}}$ and finally $\Delta \boldsymbol{G}^{\circ}{ }_{\mathrm{rxn}}$.

| Species | $\Delta H_{f} \rho(\mathrm{~kJ} / \mathrm{mol})$ | $S^{\circ}(\mathrm{J} / \mathrm{K} \cdot \mathrm{mol})$ |
| :--- | :--- | :--- |
| $\mathrm{P}_{4} \mathrm{O}_{10}(\mathrm{~s})$ | -2984.0 | 228.9 |
| $\mathrm{H}_{2} \mathrm{O}(l)$ | -285.8 | 69.95 |
| $\mathrm{H}_{3} \mathrm{PO}_{4}(l)$ | -1279.0 | 110.5 |

```
\DeltaHrxn = -417.2 kJ/mol
\DeltaSrxn = -206.6 J/mol
```

$\Delta \mathbf{G r x n}^{\mathbf{~}} \mathbf{- 3 5 5 . 6} \mathbf{~ k J} / \mathbf{m o l}$

Question \#2: ( 5 points) One kind of battery used in watches contains mercury(II) oxide. As current flows, the mercury(II) oxide is reduced to mercury: $\mathbf{H g O}(\mathbf{s})+\mathbf{H}_{2} \mathbf{O}(\boldsymbol{l})+\mathbf{2} \mathrm{e}^{-} \boldsymbol{\rightarrow} \mathbf{H g}(\boldsymbol{l})+\mathbf{2} \mathbf{O H}^{-}(\mathrm{aq})$

If $2.3 \times 10^{-5}$ amperes flows continuously for 1200 days, what mass of $\mathrm{Hg}(l)$ is produced?

## 2.5 g Hg

Question \#3: ( 5 points) Write a balanced chemical equation for the following reaction in an acidic solution.

$$
\begin{aligned}
\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+\mathrm{Ni}(\mathrm{~s}) \rightarrow \mathrm{Cr}^{3+}(\mathrm{aq})+\mathrm{Ni}^{2+}(\mathrm{aq}) \\
\mathrm{Cr}_{2} \mathrm{O}_{7^{2-}}(\mathrm{aq})+\mathbf{1 4} \mathbf{H}^{+}(\mathrm{aq})+\mathbf{3 N i}(\mathrm{s}) \rightarrow \mathbf{2} \mathbf{C r}^{3+}(\mathrm{aq})+\mathbf{7} \mathrm{H}_{2} \mathbf{O}(\mathrm{l})+\mathbf{3} \mathrm{Ni}^{2+}(\mathrm{aq})
\end{aligned}
$$

Sample Quiz \#6 Name: $\qquad$ Lab Section: $\qquad$
Be sure to show all work, use the correct number of significant figures, circle final answers and use correct units in all problems.
Question \#1: (10 points total, 2 points each)

- Circle the ion(s) with a $[\mathrm{Ar}] 3 d^{5}$ electron configuration: $\mathrm{Co}^{2+} \quad \mathrm{Mn}^{2+} \quad \mathrm{Fe}^{3+}$ ?
- Identify the neutral element with the ground state electron configuration $[\mathrm{Xe}] 4 f^{14} 5 d^{6} 6 s^{2}$. $\qquad$
- What is the highest oxidation state for chromium?
- What is the oxidation state of iron in $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ ? $\qquad$
- List a possible geometry of a metal complex with a coordination number of four:

Question \#2: (10 points) Provide the right name or formula for the coordination compounds below.
hexacarbonylruthenium(III) perchlorate
dicyanobis(ethylenediamine)zirconium(IV) nitrate
$\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Cu}(\mathrm{CN})_{4}\right]$
potassium tetrachloroplatinate(II)

Sample Quiz \#6 Name: $\qquad$ Lab Section: $\qquad$
Answers
Question \#1: (10 points total, 2 points each)

- Circle the ion(s) with a $[\mathrm{Ar}] 3 d^{5}$ electron configuration: $\mathrm{Co}^{2+} \quad \mathbf{M n}^{2+} \quad \mathrm{Fe}^{3+}$ ?
- Identify the neutral element with the ground state electron configuration $[\mathrm{Xe}] 4 f^{44} 5 d^{6} 6 s^{2}$.
osmium
- What is the highest oxidation state for chromium?
$+\underline{+6}$
- What is the oxidation state of iron in $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ ? $+2$
- List a possible geometry of a metal complex with a coordination number of four:
tetrahedral or square planar

Question \#2: (10 points) Provide the right name or formula for the coordination compounds below.

| Name | Formula |
| :---: | :---: |
| diaquabis(ethylenediammine)chromium(II) sulfate | $\left[\mathrm{Cr}(\mathrm{en})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{SO}_{4}$ |
|  | $\left[\mathrm{Ru}(\mathrm{CO})_{6}\right]\left(\mathrm{ClO}_{4}\right)_{3}$ |
|  | $\left[\mathrm{Zr}(\mathrm{CN})_{2}(\mathrm{en})_{2}\right]\left(\mathrm{NO}_{3}\right)_{2}$ |
| ammonium tetracyanocuprate(II) | $\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Cu}(\mathrm{CN})_{4}\right]$ |
| potassium tetrachloroplatinate(II) | $\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]$ |

$\qquad$
$\qquad$
Part I: Multiple Choice Questions (100 Points) Use a scantron sheet for Part I. There is only one best answer for each question.

1. Write the expression for K for the reaction: $\mathbf{A l}_{2} \mathbf{S}_{\mathbf{3}}(\mathbf{s}) \rightleftharpoons \mathbf{2} \mathbf{A l}^{\mathbf{3 +}}(\mathbf{a q})+\mathbf{3} \mathbf{S}^{\mathbf{2 -}(\mathrm{aq})}$
a.

$$
K=\left[\mathrm{Al}^{3+}\right]^{2}\left[\mathrm{~S}^{2-}\right]^{3}
$$

b. $K=\left[\mathrm{Al}^{3+}\right]\left[\mathrm{S}^{2-}\right]$
c. $K=\left[2 \mathrm{Al}^{3+}\right]\left[3 \mathrm{~S}^{2-}\right]$
d.
$K=\frac{\left[\mathrm{Al}_{2} \mathrm{~S}_{3}\right]}{\left[\mathrm{Al}^{3+}\right]^{2}\left[\mathrm{~S}^{2-}\right]^{3}}$
e.

$$
K=\frac{\left[\mathrm{Al}^{3+}\right]^{2}\left[\mathrm{~S}^{2-}\right]^{3}}{\left[\mathrm{Al}_{2} \mathrm{~S}_{3}\right]}
$$

2. Write the expression for $K_{p}$ for the reaction: $\mathbf{2} \mathbf{H B r}(\mathbf{g}) \rightleftharpoons \mathbf{H}_{2}(\mathbf{g})+\mathbf{B r}_{2}(\mathbf{l})$
a.

$$
K_{\mathrm{p}}=\frac{P_{\mathrm{HBr}}^{2}}{P_{\mathrm{Br}_{2}} P_{\mathrm{H}_{2}}}
$$

b.

$$
K_{\mathrm{p}}=\frac{P_{\mathrm{H}_{2}}}{P_{\mathrm{HBr}}^{2}}
$$

c. $\quad K_{\mathrm{p}}=P_{\mathrm{HBr}}^{2}$
$K_{\mathrm{p}}=\frac{P_{\mathrm{HBr}}^{2}}{P_{\mathrm{H}_{2}}}$
e. $K_{\mathrm{p}}=\frac{P_{\mathrm{H}_{2}} P_{\mathrm{Br}_{2}}}{P_{\mathrm{HBr}}^{2}}$
3. A 4.00 L flask is filled with $0.75 \mathrm{~mol} \mathrm{SO}_{3}, 2.50 \mathrm{~mol} \mathrm{SO}_{2}$, and $1.30 \mathrm{~mol} \mathrm{O}_{2}$, and allowed to reach equilibrium. Predict the effect on the concentrations of $\mathrm{SO}_{3}$ as equilibrium is achieved by using Q , the reaction quotient. Assume the temperature of the mixture is chosen so that $\mathrm{K}_{\mathrm{c}}=12.2 \mathrm{SO}_{\mathbf{3}}(\mathrm{g}) \rightleftharpoons 2 \mathrm{SO}_{\mathbf{2}}(\mathrm{g})+\mathbf{O}_{\mathbf{2}}(\mathrm{g})$
a. $\left[\mathrm{SO}_{3}\right]$ will decrease because $\mathrm{Q}>\mathrm{K}$.
b. $\quad\left[\mathrm{SO}_{3}\right]$ will decrease because $\mathrm{Q}<\mathrm{K}$.
c. $\left[\mathrm{SO}_{3}\right]$ will increase because $\mathrm{Q}<\mathrm{K}$.
d. $\left[\mathrm{SO}_{3}\right]$ will increase because $\mathrm{Q}>\mathrm{K}$.
e. $\left[\mathrm{SO}_{3}\right]$ will remain the same because $\mathrm{Q}=\mathrm{K}$.
4. This reaction below is studied at a high temperature. $\mathbf{P C l}_{\mathbf{5}}(\mathbf{g}) \rightleftharpoons \mathbf{P C l}_{\mathbf{3}}(\mathbf{g})+\mathbf{C l}_{\mathbf{2}} \mathbf{( g )}$ At equilibrium, the partial pressures of the gases are as follows: $\mathrm{PCl}_{5}=1.8 \times 10^{-2} \mathrm{~atm}, \mathrm{PCl}_{3}=5.6 \times 10^{-2} \mathrm{~atm}$, and $\mathrm{Cl}_{2}=3.8 \times 10^{-4} \mathrm{~atm}$. What is the value of $\mathrm{K}_{\mathrm{p}}$ for the reaction?
a. $\quad 3.8 \times 10^{-7}$
b. $1.2 \times 10^{-3}$
c. 3.1
d. $8.5 \times 10^{2}$
e. $2.6 \times 10^{6}$
5. A sealed tube is prepared with $1.07 \mathrm{~atm} \mathrm{PCl}_{5}$ at 500 K . The $\mathrm{PCl}_{5}$ decomposes until equilibrium is established; 1.54 atm is the equilibrium pressure of the tube. Calculate $\mathrm{K}_{\mathrm{p}}$ using the equation: $\mathbf{P C l}_{\mathbf{5}}(\mathbf{g}) \rightleftharpoons \mathbf{P C l}_{\mathbf{3}}(\mathbf{g})+\mathbf{C l}_{\mathbf{2}}(\mathbf{g})$
a. 0.052
b. 0.20
c. 0.27
d. 0.37
e. 2.2
6. Hydrogen monoiodide can decompose into hydrogen and iodine gases: $\mathbf{2} \mathbf{H I}(\mathbf{g}) \rightleftharpoons \mathbf{H}_{\mathbf{2}}(\mathbf{g})+\mathbf{I}_{\mathbf{2}}(\mathbf{g}) \quad \mathbf{K}_{\mathbf{p}}=\mathbf{0 . 0 1 6}$ at $-17{ }^{\circ} \mathrm{C}$. If 0.820 atm of $\mathrm{HI}(\mathrm{g})$ is sealed in a flask at $-17^{\circ} \mathrm{C}$, what is the pressure of each gas when equilibrium is established?
a. $\mathrm{HI}=0.576 \mathrm{~atm}, \mathrm{H}_{2}=0.096 \mathrm{~atm}, \mathrm{I}_{2}=0.096 \mathrm{~atm}$
b. $\mathrm{HI}=0.654 \mathrm{~atm}, \mathrm{H}_{2}=0.083 \mathrm{~atm}, \mathrm{I}_{2}=0.083 \mathrm{~atm}$
c. $\mathrm{HI}=0.728 \mathrm{~atm}, \mathrm{H}_{2}=0.092 \mathrm{~atm}, \mathrm{I}_{2}=0.092 \mathrm{~atm}$
d. $\mathrm{HI}=0.737 \mathrm{~atm}, \mathrm{H}_{2}=0.083 \mathrm{~atm}, \mathrm{I}_{2}=0.083 \mathrm{~atm}$
e. $\mathrm{HI}=0.768 \mathrm{~atm}, \mathrm{H}_{2}=0.111 \mathrm{~atm}, \mathrm{I}_{2}=0.111 \mathrm{~atm}$
7. Using the chemical reactions below, determine the equilibrium constant for the following reaction:

$$
\mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathbf{l}) \rightleftharpoons \mathrm{Ca}(\mathbf{O H})_{2}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})
$$

$\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})$

$$
K=6.5 \times 10^{-6}
$$

$\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftharpoons \mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
$K=1.0 \times 10^{-14}$
a. $\quad 1.5 \times 10^{-23}$
b. $\quad 6.5 \times 10^{-20}$
c. $\quad 1.3 \times 10^{-19}$
d. $1.5 \times 10^{-9}$
e. $1.5 \times 10^{19}$
8. Hydrogen and iodine react to form hydrogen monoiodide according to: $\mathbf{H}_{\mathbf{2}}(\mathbf{g})+\mathbf{I}_{\mathbf{2}}(\mathbf{g}) \rightleftharpoons \mathbf{2} \mathbf{~ H I}(\mathbf{g}) \quad \mathbf{K}_{\mathbf{c}}=\mathbf{0 . 5 0 4}$ at $25^{\circ} \mathrm{C}$. If initial concentrations of $0.170 \mathrm{M} \mathrm{H}_{2}$ and $0.170 \mathrm{M} \mathrm{I}_{2}$ are allowed to equilibrate, what is the equilibrium concentration of HI ?
a. $\quad 0.0445 \mathrm{M}$
b. 0.0891 M
c. $\quad 0.0684 \mathrm{M}$
d. 0.0706 M
e. $\quad 0.0129 \mathrm{M}$
9. Which of the following is never a Brønsted-Lowry acid in an aqueous solution?
a. hydrogen monochloride, $\mathrm{HCl}(\mathrm{g})$
b. dihydrogen monosulfide, $\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$
c. ammonium chloride, $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{s})$
d. hydrogen monofluoride, $\mathrm{HF}(\mathrm{g})$
e. sodium perchlorate, $\mathrm{NaClO}_{4}(\mathrm{~s})$
10. What is the conjugate base of $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{3+}(\mathrm{aq})$ ?
a. $\mathrm{H}_{3} \mathrm{O}^{+}$
b. $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}\right]^{2+}$
c. $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{H}_{3} \mathrm{O}\right]^{4+}$
d. $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$
e. $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{3+}$
11. At $25^{\circ} \mathrm{C}$, what is the $\mathrm{H}_{3} \mathrm{O}^{+}$concentration in $0.044 \mathrm{M} \mathrm{NaOH}(\mathrm{aq})$ ?
a. $\quad 4.4 \times 10^{-16} \mathrm{M}$
b. $\quad 2.3 \times 10^{-13} \mathrm{M}$
c. $\quad 4.4 \times 10^{-7} \mathrm{M}$
d. 1.36 M
e. 12.6 M
12. Assuming equal initial concentrations of the given species, which of the following weak acids has the strongest conjugate base in an aqueous solution?
a. acetic acid, $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}$
b. formic acid, $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-4}$
c. hydrogen sulfite ion, $\mathrm{K}_{\mathrm{a}}=6.2 \times 10^{-8}$
d. nitrous acid, $\mathrm{K}_{\mathrm{a}}=4.5 \times 10^{-4}$
e. phosphoric acid, $\mathrm{K}_{\mathrm{a}}=7.5 \times 10^{-3}$
13. Given the following acid dissociation constants,
$K_{\mathrm{a}}(\mathrm{HF})=7.2 \times 10^{-4}$
$K_{\mathrm{a}}\left(\mathrm{NH}_{4}^{+}\right)=5.6 \times 10^{-10}$
determine the equilibrium constant for the reaction below at $25^{\circ} \mathrm{C}$.
$\mathbf{H F}(\mathrm{aq})+\mathrm{NH}_{3}(\mathrm{aq}) \rightleftharpoons \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{F}^{-}(\mathrm{aq})$
a. $\quad 4.0 \times 10^{-13}$
b. $\quad 1.3 \times 10^{-8}$
c. $7.8 \times 10^{-7}$
d. $1.3 \times 10^{6}$
e. $2.5 \times 10^{12}$
14. What is the pH of $5.0 \times 10^{-3} \mathrm{M} \mathrm{HF}$ ? The $\mathrm{K}_{\mathrm{a}}$ for hydrofluoric acid is $7.2 \times 10^{-4}$. Hint: Is $100^{*} K<C$ ?
a. $\quad 2.72$
b. 2.80
c. $\quad 4.60$
d. 5.44
e. $\quad 6.12$
15. A solution is made by diluting 0.50 mol NaClO to a volume of 3.0 L with water. What is the pH of the solution? $\left(\mathrm{K}_{\mathrm{b}}\right.$ of $\mathrm{ClO}^{-1}=$ $2.9 \times 10^{-7}$ )
a. 3.66
b. 7.46
c. $\quad 10.34$
d. 10.58
e. 13.22
16. What is the effect of adding 10 mL of $0.1 \mathrm{M} \mathrm{NaOH}(\mathrm{aq})$ to 100 mL of $0.2 \mathrm{M} \mathrm{NH}_{4}^{+}(\mathrm{aq})$ ?

1. The pH will decrease.
2. The concentration of $\mathrm{NH}_{3}$ will increase.
3. The concentration of $\mathrm{NH}_{4}{ }^{+}$will decrease.
a. 1 only
b. 2 only
c. 3 only
d. 2 and 3
e. 1,2 , and 3
4. What is the pH of a solution that results from adding 25 mL of 0.50 M NaOH to 75 mL of $0.50 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ ? (Note that the $\mathrm{K}_{\mathrm{a}}$ of $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}=1.8 \times 10^{-5}$ )
a. 2.67
b. 3.17
c. 4.44
d. 5.04
e. 5.35
5. What is the pH of an aqueous solution of 0.30 M HF and $0.15 \mathrm{M} \mathrm{F}^{-}$? $\left(\mathrm{K}_{\mathrm{a}}\right.$ of $\left.\mathrm{HF}=7.2 \times 10^{-4}\right)$
a. $\quad 1.83$
b. 2.84
c. 3.14
d. 3.44
e. 10.86
6. Which of the following combinations would be best to buffer an aqueous solution at a pH of 2.0 ?
a. $\quad \mathrm{H}_{3} \mathrm{PO}_{4}$ and $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}, \mathrm{K}_{\mathrm{a} 1}=7.5 \times 10^{-3}$
b. $\mathrm{HNO}_{2}$ and $\mathrm{NO}_{2}^{-1}, \mathrm{~K}_{\mathrm{a}}=4.5 \times 10^{-4}$
c. $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and $\mathrm{CH}_{3} \mathrm{COO}^{-1}, \mathrm{~K}_{\mathrm{a}}=1.8 \times 10^{-5}$
d. $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-1}$ and $\mathrm{HPO}_{4}{ }^{2-}, \mathrm{K}_{\mathrm{a} 2}=6.2 \times 10^{-8}$
e. $\mathrm{NH}_{4}{ }^{+}$and $\mathrm{NH}_{3}, \mathrm{~K}_{\mathrm{a}}=5.7 \times 10^{-10}$
7. What is the pH of the buffer that results when 11 g of $\mathrm{NaCH}_{3} \mathrm{CO}_{2}$ is mixed with 85 mL of $1.0 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and diluted with water to 1.0 L ? $\left(\mathrm{K}_{\mathrm{a}}\right.$ of $\left.\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}=1.8 \times 10^{-5}\right)$
a. 2.91
b. 3.86
c. 4.55
d. 4.74
e. 4.94
8. The $\mathrm{K}_{\mathrm{a}}$ of hypochlorous acid, HClO , is $3.5 \times 10^{-8}$. What $\left[\mathrm{ClO}^{-}\right] /[\mathrm{HClO}]$ ratio is necessary to make a buffer with a pH of 7.71 ?
a. $\quad 2.0 \times 10^{-8}$
b. 0.25
c. 0.56
d. 1.8
e. 3.9
9. What volume of 0.50 M NaOH should be added to 2.0 L of $0.25 \mathrm{M} \mathrm{HCO}_{3}{ }^{-1}$ to make a buffer with a pH of 10.02 ? (Note that the $\mathrm{pKa}_{\mathrm{a}}$ of $\mathrm{HCO}_{3}{ }^{-1}=10.32$ )
a. $\quad 0.17 \mathrm{~mL}$
b. 83 mL
c. $2.5 \times 10^{2} \mathrm{~mL}$
d. $\quad 3.3 \times 10^{2} \mathrm{~mL}$
e. $5.0 \times 10^{2} \mathrm{~mL}$
10. A volume of 25.0 mL of $0.100 \mathrm{M} \mathrm{HCO}_{2} \mathrm{H}(\mathrm{aq})$ is titrated with $0.100 \mathrm{M} \mathrm{NaOH}(\mathrm{aq})$. What is the pH after the addition of 12.5 mL of $\mathrm{NaOH} ?\left(\mathrm{~K}_{\mathrm{a}}\right.$ for $\left.\mathrm{HCO}_{2} \mathrm{H}=1.8 \times 10^{-4}\right)$
a. 2.52
b. $\quad 3.74$
c. 4.74
d. 7.00
e. 10.26
11. A 50.0 mL sample of $0.0240 \mathrm{M} \mathrm{NH}_{3}(\mathrm{aq})$ is titrated with aqueous hydrochloric acid. What is the pH after the addition of 15.0 mL of $0.0600 \mathrm{M} \mathrm{HCl}(\mathrm{aq}) ?\left(\mathrm{~K}_{\mathrm{b}}\right.$ of $\left.\mathrm{NH}_{3}=1.8 \times 10^{-5}\right)$
a. $\quad 8.78$
b. 8.86
c. 9.25
d. 9.38
e. 9.73
12. Which is the best colored indicator to use in the titration of $0.0010 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-1}(\mathrm{aq})$ with $\mathrm{HCl}(\mathrm{aq})$ ? Why? (Note that the $\mathrm{K}_{\mathrm{b}}$ of $\mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-1}=5.6 \times 10^{-10}$ )

| Indicator | $\mathrm{p} K_{\mathrm{a}}$ |
| :--- | :--- |
| Bromocresol green | 4.7 |
| Phenol Red | 7.8 |
| Phenolphthalein | 9.0 |

a. Bromocresol green. The pH at the equivalence point is less than 7.0.
b. Phenol Red. The $\mathrm{pK}_{\mathrm{b}}$ of acetate ion and the $\mathrm{pK}_{\mathrm{b}}$ of the indicator are similar.
c. Phenol Red. The equivalence point of an acid-base titration occurs at a pH of 7.0.
d. Phenolphthalein. The $\mathrm{pK}_{\mathrm{b}}$ of acetate ion and the $\mathrm{pK}_{\mathrm{b}}$ of the indicator are similar.
e. Phenolphthalein. The pH at the equivalence point is greater than 7.0.

Part II: Short Answer / Calculation. Show all work!

1. Consider a 1.00 L solution which is $0.700 \mathrm{M} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ and $0.600 \mathrm{M} \mathrm{NaCH}_{3} \mathrm{CO}_{2} . \mathrm{K}_{\mathrm{a}}=1.8^{*} 10^{-5}$
a. What is the pH of the initial solution?
b. Calculate the pH upon adding 10.00 mL of 1.00 M HCl to the solution from part a .
c. Calculate the pH upon adding 15.00 mL of 2.10 M NaOH to the solution from part a .
2. Consider the reaction: $\mathbf{B}_{2} \mathbf{H}_{\mathbf{6}}(\mathbf{g}) \rightleftharpoons 2 \mathbf{B H}_{\mathbf{3}}(\mathbf{g}), \Delta \mathbf{H}=+\mathbf{1 1 2} \mathbf{k J}$ Use Le Chatelier's principle to predict the effect of the following changes on this reaction at equilibrium. Write RIGHT, LEFT or NO CHANGE to indicate the effect observed.

Effect
Addition of $\mathrm{B}_{2} \mathrm{H}_{6}$ :
Addition of a catalyst:
$\qquad$
,
$\qquad$
Increasing the pressure: $\qquad$
Removal of $\mathrm{BH}_{3}$ :
Increasing temperature:
$\qquad$
$\qquad$
3. A solution contains 50.0 mL of 0.100 M acetic acid $\left(\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right) . \mathrm{K}_{\mathrm{a}}=1.8^{*} 10^{-5}$
a. What is the pH of the initial acetic acid solution?
b. What is the pH after 10.0 mL of 0.100 M NaOH has been added to the mixture?
c. What is the pH after 40.0 mL of 0.100 M NaOH has been added to the mixture?
d. How many mL of 0.100 M NaOH are required to reach the equivalence point?
e. How many mL of 0.100 M NaOH are required to reach the half-equivalence point? What is the pH of the solution at the half-equivalence point?
f. What is the pH at the equivalence point?
g. What is the pH after 60.0 mL of 0.100 M NaOH has been added to the mixture?

Part II: Short Answer / Calculation.

1. Buffer question:
a. 4.67
b. 4.66
c. $\quad 4.72$
2. Le Chatelier's Principle question:
a. right
b. no change
c. left
d. right
e. right
3. Titration question:
a. $\quad 2.87$
b. 4.14
c. $\quad 5.34$
d. $\quad 50.0 \mathrm{~mL}$
e. $\quad 25.0 \mathrm{~mL}, 4.74$
f. $\quad 8.72$
g. 11.96
$\qquad$
$\qquad$
Part I: Multiple Choice Questions (100 Points) Use a scantron sheet for Part I. There is only one best answer for each question.
4. Which of the following equations is the solubility product for magnesium iodate, $\mathrm{Mg}\left(\mathrm{IO}_{3}\right)_{2}$ ?
a. $K_{\mathrm{sp}}=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{I}^{-1}\right]^{2}\left[\mathrm{O}^{-2}\right]^{6}$
b. $K_{\text {sp }}=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{I}^{-1}\right]^{2}\left[3 \mathrm{O}^{-2}\right]^{2}$
c. $K_{\text {sp }}=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{IO}_{3}^{-1}\right]$
d. $K_{\text {sp }}=\left[\mathrm{Mg}^{2+}\right]^{2}\left[\mathrm{IO}_{3}^{-1}\right]$
e. $K_{\text {sp }}=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{IO}_{3}^{-1}\right]^{2}$
5. The solubility of $\mathrm{SrSO}_{4}$ in water is 0.107 g in 1.0 L at $25^{\circ} \mathrm{C}$. What is the value of $K_{\text {sp }}$ for $\mathrm{SrSO}_{4}$ ?
a. $\quad 3.4 \times 10^{-7}$
b. $5.8 \times 10^{-4}$
c. $1.2 \times 10^{-3}$
d. $1.1 \times 10^{-2}$
e. $2.1 \times 10^{-1}$
6. The solubility of lead (II) chloride, $\mathrm{PbCl}_{2}$, is $1.6 \times 10^{-2} \mathrm{M}$. What is the $K_{\text {sp }}$ of $\mathrm{PbCl}_{2}$ ?
a. $\quad 5.0 \times 10^{-4}$
b. $\quad 4.1 \times 10^{-6}$
c. $\quad 3.1 \times 10^{-7}$
d. $1.6 \times 10^{-5}$
e. $1.6 \times 10^{-2}$
 $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ is $8.1 \times 10^{-12}$.
a. $\quad 1.8 \times 10^{-5}$
b. $\quad 1.4 \times 10^{-6}$
c. $2.8 \times 10^{-6}$
d. $\quad 3.2 \times 10^{-10}$
e. $8.1 \times 10^{-12}$
7. The $K_{\text {sp }}$ for $\mathrm{Zn}(\mathrm{OH})_{2}$ is $5.0 \times 10^{-17}$. Determine the molar solubility of $\mathrm{Zn}(\mathrm{OH})_{2}$ in a buffer solution with a pH of 11.5 .
a. $\quad 5.0 \times 10^{6}$
b. $\quad 1.2 \times 10^{-12}$
c. $\quad 1.6 \times 10^{-14}$
d. $5.0 \times 10^{-12}$
e. $5.0 \times 10^{-17}$
8. The molar solubility of $\qquad$ is not affected by the pH of the solution.
a. $\quad \mathrm{Na}_{3} \mathrm{PO}_{4}$
b. NaF
c. $\mathrm{KNO}_{3}$
d. $\mathrm{AlCl}_{3}$
e. MnS
9. Consider the reaction

$$
\mathrm{Zn}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{OH}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{Zn}(\mathrm{OH})_{4}{ }^{2-}(\mathrm{aq}) \quad \boldsymbol{K}=\mathbf{8 . 7} \times \mathbf{1 0}^{-\mathbf{2}}
$$

If $\boldsymbol{K}_{\text {sp }}$ for $\mathrm{Zn}(\mathrm{OH})_{2}$ is $\mathbf{3 . 0} \times \mathbf{1 0}^{\mathbf{- 1 7}}$, what is the value of the formation constant, $K_{\text {form }}$, for the reaction below?
$\mathbf{Z n}^{2+}(\mathbf{a q})+4 \mathbf{O H}^{-}(\mathbf{a q}) \rightleftharpoons \mathbf{Z n}(\mathbf{O H}) 4^{2-}(\mathbf{a q})$
a. $\quad 2.6 \times 10^{-18}$
b. $\quad 3.4 \times 10^{-16}$
c. $\quad 2.9 \times 10^{15}$
d. $3.3 \times 10^{16}$
e. $3.8 \times 10^{17}$
8. The following anions can be separated by precipitation as silver salts: $\mathrm{Cl}^{-1}, \mathrm{Br}^{-1}, \mathrm{I}^{-1}, \mathrm{CrO}_{4}{ }^{2-}$. If $\mathrm{Ag}^{+}$is added to a solution containing the four anions, each at a concentration of 0.10 M , in what order will they precipitate?

| Compound | $K_{\text {sp }}$ |
| :--- | :--- |
| AgCl | $1.8 \times 10^{-10}$ |
| $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ | $1.1 \times 10^{-12}$ |
| $\mathrm{AgBr}_{\mathrm{AgI}}$ | $5.4 \times 10^{-13}$ |
|  | $8.5 \times 10^{-17}$ |

a. $\mathrm{AgCl} \rightarrow \mathrm{Ag}_{2} \mathrm{CrO}_{4} \rightarrow \mathrm{AgBr} \rightarrow \mathrm{AgI}$
b. $\mathrm{AgI} \rightarrow \mathrm{AgBr} \rightarrow \mathrm{Ag}_{2} \mathrm{CrO}_{4} \rightarrow \mathrm{AgCl}$
c. $\mathrm{Ag}_{2} \mathrm{CrO}_{4} \rightarrow \mathrm{AgCl} \rightarrow \mathrm{AgBr} \rightarrow \mathrm{AgI}$
d. $\mathrm{Ag}_{2} \mathrm{CrO}_{4} \rightarrow \mathrm{AgI} \rightarrow \mathrm{AgBr} \rightarrow \mathrm{AgCl}$
e. $\mathrm{AgI} \rightarrow \mathrm{AgBr} \rightarrow \mathrm{AgCl} \rightarrow \mathrm{Ag}_{2} \mathrm{CrO}_{4}$
9. A statement of the second law of thermodynamics is that
a. spontaneous reactions are always exothermic.
b. energy is conserved in a chemical reaction.
c. the Gibbs free energy is a function of both enthalpy and entropy.
d. $\Delta \mathrm{S}=-\Delta \mathrm{H}$ for any chemical reaction.
e. in a spontaneous process, the entropy of the universe increases.
10. As defined by Ludwig Boltzmann, the third law of thermodynamics states that
a. in a spontaneous process, the entropy of the universe increases.
b. there is no disorder in a perfect crystal at 0 K .
c. the total entropy of the universe is always increasing.
d. the total energy of the universe is constant.
e. mass and energy are conserved in all chemical reactions.
11. Which of the following processes involves a decrease in entropy?
a. the decomposition of $\mathrm{NH}_{3}(\mathrm{~g})$ into $\mathrm{H}_{2}(\mathrm{~g})$ and $\mathrm{N}_{2}(\mathrm{~g})$ gas
b. the dissolution of NaCl in water
c. the condensation of steam to liquid water
d. the evaporation of ethanol
e. the sublimation of dry ice (i.e., $\mathrm{CO}_{2}(\mathrm{~s})$ )
12. Calculate the standard entropy change for the following reaction,
$2 \mathrm{HgO}(\mathrm{s}) \rightleftharpoons 2 \mathrm{Hg}(\mathrm{l})+\mathrm{O}_{2}(\mathrm{~g})$
given $S^{\circ}[\mathrm{HgO}]=70.3 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}, S^{\circ}[\mathrm{Hg}(\mathrm{l})]=76.0 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$, and $S^{\circ}\left[\mathrm{O}_{2}(\mathrm{~g})\right]=205.1 \mathrm{~J} / \mathrm{K} \cdot \mathrm{mol}$.
a. $\quad-216.5 \mathrm{~J} / \mathrm{K}$
b. $+210.8 \mathrm{~J} / \mathrm{K}$
c. $+216.5 \mathrm{~J} / \mathrm{K}$
d. $+351.4 \mathrm{~J} / \mathrm{K}$
e. $+497.7 \mathrm{~J} / \mathrm{K}$
13. Predict the signs of $\Delta \mathrm{H}, \Delta \mathrm{S}$, and $\Delta \mathrm{G}$ for the evaporation of water $25^{\circ} \mathrm{C}$.
a. $\Delta \mathrm{H}>0, \Delta \mathrm{~S}<0, \Delta \mathrm{G}<0$
b. $\Delta \mathrm{H}>0, \Delta \mathrm{~S}>0, \Delta \mathrm{G}>0$
c. $\Delta \mathrm{H}<0, \Delta \mathrm{~S}>0, \Delta \mathrm{G}<0$
d. $\Delta \mathrm{H}<0, \Delta \mathrm{~S}>0, \Delta \mathrm{G}>0$
e. $\Delta \mathrm{H}<0, \Delta \mathrm{~S}<0, \Delta \mathrm{G}<0$
14. The dissolution of ammonium nitrate occurs spontaneously in water at $25^{\circ} \mathrm{C}$. As $\mathrm{NH}_{4} \mathrm{NO}_{3}$ dissolves, the temperature of the water decreases. What are the signs of $\Delta \mathrm{H}, \Delta \mathrm{S}$, and $\Delta \mathrm{G}$ for this process?
a. $\Delta \mathrm{H}>0, \Delta \mathrm{~S}<0, \Delta \mathrm{G}>0$
b. $\Delta \mathrm{H}>0, \Delta \mathrm{~S}>0, \Delta \mathrm{G}>0$
c. $\Delta \mathrm{H}>0, \Delta \mathrm{~S}>0, \Delta \mathrm{G}<0$
d. $\Delta \mathrm{H}<0, \Delta \mathrm{~S}<0, \Delta \mathrm{G}<0$
e. $\Delta H<0, \Delta S>0, \Delta \mathrm{G}>0$
15. Diluting concentrated sulfuric acid with water can be dangerous. The temperature of the solution can increase rapidly. What are the signs of $\Delta \mathrm{H}, \Delta \mathrm{S}$, and $\Delta \mathrm{G}$ for this process?
a. $\Delta H<0, \Delta S>0, \Delta G<0$
b. $\Delta H<0, \Delta S<0, \Delta G<0$
c. $\Delta H<0, \Delta S>0, \Delta G>0$
d. $\Delta H>0, \Delta S>0, \Delta G<0$
e. $\Delta H>0, \Delta S<0, \Delta G>0$
16. At what temperatures will a reaction be spontaneous if $\Delta \mathrm{H}=-76.0 \mathrm{~kJ}$ and $\Delta \mathrm{S}=+231 \mathrm{~J} / \mathrm{K}$ ?
a. All temperatures below 329 K
b. Temperatures between 0 K and 231 K
c. All temperatures above 329 K
d. The reaction will be spontaneous at any temperature.
e. The reaction will never be spontaneous.
17. Calculate $\Delta \mathrm{G}^{\circ}{ }_{\mathrm{rxn}}$ for the reaction below at $25.0^{\circ} \mathrm{C}$

$$
\mathrm{CO}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})
$$

given $\Delta \mathrm{G}_{f}^{\circ}[\mathrm{CO}(\mathrm{g})]=-137.2 \mathrm{~kJ} / \mathrm{mol}, \Delta \mathrm{G}_{f}^{\circ}\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{l})\right]=-237.2 \mathrm{~kJ} / \mathrm{mol}$ and $\Delta \mathrm{G}^{\circ}\left[\mathrm{CO}_{2}(\mathrm{~g})\right]=-394.4 \mathrm{~kJ} / \mathrm{mol}$.
a. $\quad-768.8 \mathrm{~kJ}$
b. -294.4 kJ
c. -20.0 kJ
d. +20.0 kJ
e. +768.8 kJ
18. $\qquad$ is reduced in the following reaction: $\mathbf{C r}_{2} \mathrm{O}_{7}{ }^{2-}+\mathbf{6} \mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}+\mathbf{1 4} \mathbf{H}^{+1} \rightarrow \mathbf{2} \mathbf{C r}^{3+}+\mathbf{3} \mathbf{S}_{4} \mathbf{O}_{6}{ }^{2-}+\mathbf{7} \mathbf{H}_{2} \mathbf{O}$
a. $\mathrm{Cr}^{6+}$
b. $\mathrm{S}^{2+}$
c. $\mathrm{H}^{+1}$
d. $\mathrm{O}^{2-}$
e. $\mathrm{S}_{4} \mathrm{O}_{6}{ }^{2-}$
19. Which substance is the reducing agent in the following reaction: $\mathbf{C r}_{2} \mathbf{O}_{7}{ }^{2-}+\mathbf{3} \mathbf{N i}+\mathbf{1 4} \mathbf{H}^{+1} \rightarrow \mathbf{2} \mathbf{C r}^{\mathbf{3 +}}+\mathbf{3} \mathbf{N i}^{2+}+\mathbf{7} \mathbf{H}_{\mathbf{2}} \mathbf{O}$
a. Ni
b. $\mathrm{H}^{+1}$
c. $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$
d. $\mathrm{H}_{2} \mathrm{O}$
e. $\mathrm{Ni}^{2+}$
20. The balanced half-reaction in which one mole of chlorine gas is reduced to the aqueous chloride ion is a $\qquad$ process.
a. one-electron
b. two-electron
c. four-electron
d. three-electron
e. six-electron
21. The half-reaction occurring at the anode in the balanced reaction shown below is

$$
3 \mathrm{MnO}_{4}{ }^{1-}(\mathrm{aq})+5 \mathrm{Fe}(\mathrm{~s})+24 \mathrm{H}^{+1}(\mathrm{aq}) \rightarrow 3 \mathrm{Mn}^{2+}(\mathrm{aq})+5 \mathrm{Fe}^{3+}(\mathrm{aq})+12 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
$$

a. $\mathrm{MnO}_{4}{ }^{1-}(\mathrm{aq})+8 \mathrm{H}^{+1}(\mathrm{aq})+5 \mathrm{e}^{-1} \rightarrow \mathrm{Mn}^{2+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
b. $2 \mathrm{MnO}_{4}{ }^{1-}(\mathrm{aq})+12 \mathrm{H}^{+1}(\mathrm{aq})+6 \mathrm{e}^{-1} \rightarrow 2 \mathrm{Mn}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
c. $\mathrm{Fe}(\mathrm{s}) \rightarrow \mathrm{Fe}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-1}$
d. $\mathrm{Fe}(\mathrm{s}) \rightarrow \mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-1}$
e. $\mathrm{Fe}^{2+}(\mathrm{aq}) \rightarrow \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{e}^{-1}$
22. The standard cell potential ( $\mathrm{E}^{\circ}$ cell $)$ of the reaction below is $\mathbf{+ 0 . 1 2 6} \mathrm{V}$. The value of $\Delta \mathrm{G}^{\circ}$ for the reaction is $\qquad$ $\mathrm{kJ} / \mathrm{mol}$. $\mathbf{P b}(\mathbf{s})+2 \mathbf{H}^{+1}(\mathbf{a q}) \rightarrow \mathbf{P b}^{2+}(\mathbf{a q})+\mathbf{H}_{2}(\mathrm{~g})$
a. -24.3
b. +24.3
c. -12.6
d. +12.6
e. -50.8
23. How many grams of Ca metal are produced by the electrolysis of molten $\mathrm{CaBr}_{2}$ using a current of 30.0 amp for 10.0 hours?
a. $\quad 22.4$
b. 448
c. 0.0622
d. 224
e. 112
24. Which one of the following reactions is a redox reaction?
a. $\mathrm{NaOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
b. $\mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{Cl}^{-1}(\mathrm{aq}) \rightarrow \mathrm{PbCl}_{2}(\mathrm{aq})$
c. $\mathrm{AgNO}_{3}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{AgCl}(\mathrm{s})$
d. None of the above is a redox reaction.
e. All of the above are redox reactions
25. What is the coefficient for $\mathrm{Fe}^{3+}$ when the following equation is balanced? $\mathrm{CN}^{-1}+\mathrm{Fe}^{3+} \rightarrow \mathrm{CNO}^{-1}+\mathrm{Fe}^{2+}, \mathrm{pH}=10.75$
a. 1
b. 2
c. 3
d. 4
e. 5

Part II: Short Answer / Calculation. Show all work!

1. A solution contains $0.10 \mathrm{M} \mathrm{Cl}^{-}$and $0.10 \mathrm{M} \mathrm{Br}^{-}$ions. $K_{\text {sp }}$ for $\mathrm{AgCl}=1.8 \times 10^{-10}, K_{\text {sp }}$ for $\mathrm{AgBr}=3.3 \times 10^{-13}$. ( 10 points)
a. $\mathrm{AgNO}_{3}$ is added until a white solid just begins to precipitate. What is the identity of the precipitate?
b. What is the concentration of the less soluble ion once the more soluble ion begins to precipitate out of solution?

Part II: Short Answer / Calculation (continued) Show all work!
2. Calculate $\Delta G^{\circ}$ for the reaction below at $25.0^{\circ} \mathrm{C}$. ( 10 points) $\mathrm{P}_{4}(\mathrm{~s})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow 4 \mathrm{H}_{3} \mathrm{PO}_{4}(\mathrm{l})$

| Species | $\Delta \mathrm{H}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ | $\mathrm{S}^{\circ}(\mathrm{J} / \mathrm{K} \cdot \mathrm{mol})$ |
| :--- | :--- | :--- |
| $\mathrm{P}_{4}(\mathrm{~s})$ | 0 | 22.80 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | -285.8 | 69.95 |
| $\mathrm{H}_{3} \mathrm{PO}_{4}(\mathrm{l})$ | -1279.0 | 110.5 |

3. Calculate $\Delta G^{\circ}$ and the equilibrium constant, $K_{\text {eq, }}$, for the disproportionation reaction (below) of $\mathrm{Cu}^{+1}$ at $25^{\circ} \mathrm{C}$ :

$$
2 \mathrm{Cu}^{+1}(\mathrm{aq}) \rightarrow \mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{~s})
$$

given the following thermodynamic information. (10 points)

$$
\begin{array}{ll}
\mathrm{Cu}^{+}(\mathrm{aq})+\mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{~s}) & E^{\circ}=+0.518 \mathrm{~V} \\
\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{~s}) & E^{\circ}=+0.337 \mathrm{~V}
\end{array}
$$

[^2]:    *The values of $K_{\mathrm{a}}$ for $\mathrm{HS}^{-}$and $K_{\mathrm{b}}$ for $\mathrm{S}^{2-}$ are estimates.

[^3]:    *The values of $K_{\mathrm{a}}$ for $\mathrm{HS}^{-}$and $K_{\mathrm{b}}$ for $\mathrm{S}^{2-}$ are estimates.

[^4]:    1. $\mathrm{K}_{\mathrm{c}}=[\mathrm{CO}]^{2} /\left[\mathrm{CO}_{2}\right]$ or $\mathrm{K}_{\mathrm{p}}=\mathrm{Pco}^{2} / \mathrm{Pcoz}$
    2. No, $Q<K$, reaction will proceed to the right (more products)
    3. $\mathrm{K}=1.2$
    4. $\left[\mathrm{I}_{2}\right]=0.00614 \mathrm{M},[\mathrm{I}]=0.00480 \mathrm{M}$
[^5]:    1. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.8 \times 10^{-4} \mathrm{M},\left[\mathrm{OH}^{-}\right]=5.6 \times 10^{-11} \mathrm{M}$, acidic
    2. 11.48
    3. $3.0 \times 10^{-10}$
    4. $2.1 \times 10^{-4}$
    5. $0.0021 \mathrm{M}, 3.6 \times 10^{-4}\left(K_{\mathrm{a}}=3.0 \times 10^{-4}\right.$ using short method $)$
    6. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=8.1 \times 10^{-11} \mathrm{M},\left[\mathrm{OH}^{-}\right]=1.2 \times 10^{-4} \mathrm{M}, K_{b}=9.7 \times 10^{-7}$
    7. $\mathrm{Fe}^{2+}(\mathrm{aq})$ would be a Lewis acid, $\mathrm{CH}_{3} \mathrm{NH}_{2}$ would be a Lewis base
[^6]:    1. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3} \& \mathrm{ZnSO}_{4}$ (soluble), $\mathrm{NiS} \& \mathrm{BaSO}_{4}$ (insoluble)
    $K_{\text {sp }}=3.6 \times 10^{-6}$
    $K_{\text {s }}=1.4 \times 10^{-15}$
    $K_{\text {sp }}=1.4 \times 10^{-15}$
    a) $2.4 \times 10^{-4} \mathrm{M}$ b) $0.018 \mathrm{~g} / \mathrm{L}$
    2. a) $2.4 \times 10^{-4} \mathrm{M}$ b) $0.018 \mathrm{~g} / \mathrm{L}$
    3. 0.05 mg does not dissolve
    4. $\mathrm{PbCl}_{2}$
[^7]:    MAR
