

## The Chemistry of Acids and Bases Separately

Chapter 14 Part I

Chemistry 223

Professor Michael Russell

MAR Last update: 4/29/24

MAR

## Strong and Weak Acids/Bases

Generally divide acids and bases into **STRONG** or **WEAK** categories.

$\text{HNO}_3$  is about 100% dissociated in water. Acids create **hydronium** when they react with water.

## Strong and Weak Acids/Bases

$\text{HNO}_3$ ,  $\text{HCl}$ ,  $\text{HBr}$ ,  $\text{HI}$  and  $\text{HClO}_4$  are among the few known strong **monoprotic** acids.

**Memorize these five strong acids!**

MAR

MAR

## Strong and Weak Acids/Bases

**Weak acids** are much less than 100% ionized in water.

One of the best known is **acetic acid** =  $\text{CH}_3\text{CO}_2\text{H} = \text{HOAc}$

$\text{OAc}^- = \text{CH}_3\text{CO}_2^- = \text{acetate ion}$

## Strong and Weak Acids/Bases

**Strong Base:** 100% dissociated in water.

Other strong **monobasic** bases: **KOH**, **LiOH**

$\text{Ca}(\text{OH})_2$  is a strong  **dibasic** system:

**Memorize the three strong monobasic bases!**

MAR

MAR

## Strong and Weak Acids/Bases

**Weak base:** less than 100% ionized in water

One of the best known weak bases is **ammonia**,  $\text{NH}_3$

## ACID-BASE THEORIES

The most general theory for common aqueous acids and bases is the **BRØNSTED - LOWRY** theory

**ACIDS DONATE H<sup>+</sup> IONS**  
**BASES ACCEPT H<sup>+</sup> IONS**

See *Brønsted Acids and Bases Handout*

MAR

## ACID-BASE THEORIES

The Brønsted definition means NH<sub>3</sub> is a **BASE** in water - and water is itself an **ACID**

MAR

## ACID-BASE THEORIES

NH<sub>3</sub> is a **BASE** in water - and water is itself an **ACID**

NH<sub>3</sub> / NH<sub>4</sub><sup>+</sup> is a **conjugate pair** - related by the gain or loss of H<sup>+</sup>

**Every acid has a conjugate base - and vice-versa.**

MAR

## Conjugate Pairs

MAR

## MORE ABOUT WATER

H<sub>2</sub>O can function as both an **ACID** and a **BASE**.

Pure water undergoes **AUTOIONIZATION**

MAR

## MORE ABOUT WATER

$$K_w = [\text{H}_3\text{O}^+] [\text{OH}^-] = 1.00 \times 10^{-14} \text{ at } 25^\circ\text{C}$$

In a **neutral** solution  $[\text{H}_3\text{O}^+] = [\text{OH}^-]$

$$\text{so } K_w = [\text{H}_3\text{O}^+]^2 = [\text{OH}^-]^2$$

$$\text{and so } [\text{H}_3\text{O}^+] = [\text{OH}^-] = \sqrt{K_w} = 1.00 \times 10^{-7} \text{ M}$$

MAR

**Memorize  $K_w = 1.00 \times 10^{-14}$ !**

**Calculating [H<sub>3</sub>O<sup>+</sup>] & [OH<sup>-</sup>]**

You add 0.0010 mol of NaOH to 1.0 L of pure water.  
Calculate [H<sub>3</sub>O<sup>+</sup>] and [OH<sup>-</sup>].

**Solution**

Le Chatelier predicts equilibrium shifts to the

\_\_\_\_\_.

[H<sub>3</sub>O<sup>+</sup>] < 10<sup>-7</sup> at equilibrium.

Set up an **ICE** concentration table.

MAR

**Calculating [H<sub>3</sub>O<sup>+</sup>] & [OH<sup>-</sup>]**

You add 0.0010 mol of NaOH to 1.0 L of pure water.  
Calculate [H<sub>3</sub>O<sup>+</sup>] and [OH<sup>-</sup>].

**Solution**

**initial**  
**change**  
**equilib**

$$K_w = (x)(0.0010 + x)$$

Because  $x \ll 0.0010 \text{ M}$ , assume [OH<sup>-</sup>] = 0.0010 M

$$K_w = (x)(0.0010 + x) \approx (x)(0.0010) = [\text{H}_3\text{O}^+](0.0010)$$

$$[\text{H}_3\text{O}^+] = K_w / 0.0010 = 1.0 \times 10^{-11} \text{ M}$$

MAR

**Calculating [H<sub>3</sub>O<sup>+</sup>] & [OH<sup>-</sup>]**

You add 0.0010 mol of NaOH to 1.0 L of pure water.  
Calculate [H<sub>3</sub>O<sup>+</sup>] and [OH<sup>-</sup>].

**Solution**

$$[\text{H}_3\text{O}^+] = K_w / 0.0010 = 1.0 \times 10^{-11} \text{ M}$$

$$[\text{OH}^-] = 1.0 \times 10^{-3} \text{ M}$$

This solution is \_\_\_\_\_  
because  
[OH<sup>-</sup>] > [H<sub>3</sub>O<sup>+</sup>]

MAR

**[H<sub>3</sub>O<sup>+</sup>], [OH<sup>-</sup>] and pH**

A common way to express acidity and basicity is with pH

$$\text{pH} = -\log [\text{H}_3\text{O}^+]$$

In a *neutral* solution,

$$[\text{H}_3\text{O}^+] = [\text{OH}^-] =$$

$$1.0 \times 10^{-7} \text{ at } 25^\circ\text{C}$$

$$\text{pH} = -\log (1.00 \times 10^{-7})$$

$$= -(-7.00) = 7.00$$

**pH = 7.00 for neutral solutions!**

Søren Sørensen, creator of the pH scale

MAR

**[H<sub>3</sub>O<sup>+</sup>], [OH<sup>-</sup>] and pH**

What is the pH of the 0.0010 M NaOH solution?

$$[\text{H}_3\text{O}^+] = 1.0 \times 10^{-11} \text{ M}$$

$$\text{pH} = -\log (1.0 \times 10^{-11}) = 11.00$$

**General conclusion -**

**Basic solution** pH > 7

**Neutral** pH = 7

**Acidic solution** pH < 7

**Public Enemy are not scientists!**

MAR

**[H<sub>3</sub>O<sup>+</sup>], [OH<sup>-</sup>] and pH**

If the pH of Diet Coke is 3.12, it is

\_\_\_\_\_.

Because pH = -log [H<sub>3</sub>O<sup>+</sup>] then

$$\log [\text{H}_3\text{O}^+] = -\text{pH}$$

Take antilog and get

$$[\text{H}_3\text{O}^+] = 10^{-\text{pH}}$$

$$[\text{H}_3\text{O}^+] = 10^{-3.12}$$

$$= 7.6 \times 10^{-4} \text{ M}$$

MAR

## Logarithms and sig figs

Logarithms are exponents with special sig figs rules. **General rule:**

log of experimentally measured number with **N sig figs** give numbers with **N decimal places after the decimal** (digit before decimal only indicates magnitude)

Examples:

$$\log 3.07 \times 10^{-3} = -2.513 \text{ (3 sigs, 3 places after decimal)}$$

$$-\log 1.1 \times 10^{-8} = 7.96 \text{ (2 sigs, 2 places after decimal)}$$

$$10^{-3.12} = 7.6 \times 10^{-4} \text{ (2 places after decimal, 2 sigs)}$$

MAR

## pH of Common Substances

Figure 5.17 pH values of some common substances. Here the "bar" is colored red at one end and blue at the other. These are the colors of litmus paper, commonly used in the laboratory to decide if a solution is acidic (litmus is red) or basic (litmus is blue). (Charles D. Winters)

MAR

## Other pX Scales

In general

$$pX = -\log X$$

and:

$$pK_a = -\log K_a$$

and so:

$$pOH = -\log [OH^-]$$

$$K_w = [H_3O^+][OH^-] = 1.00 \times 10^{-14} \text{ at } 25^\circ C$$

Take the negative log of both sides

$$-\log(10^{-14}) = -\log [H_3O^+] + (-\log [OH^-])$$

$$14 = pH + pOH$$

$$\text{also: } 14 = pK_a + pK_b$$

MAR

acidic solutions:

- pH ↓
- $[H_3O^+] \uparrow$
- $[OH^-] \downarrow$
- pOH ↑

basic solutions: pH ↑

- $[H_3O^+] \downarrow$
- $[OH^-] \uparrow$
- pOH ↓

$$K_w = [H_3O^+][OH^-] = 1.00 \times 10^{-14} \text{ at } 25^\circ C$$

$$pH + pOH = 14$$

MAR

## Equilibria Considerations Involving Weak Acids and Bases

<b>Acid</b>	<b>Conjugate Base</b>
acetic, $CH_3CO_2H$	$CH_3CO_2^-$ , acetate
ammonium, $NH_4^+$	$NH_3$ , ammonia
bicarbonate, $HCO_3^-$	$CO_3^{2-}$ , carbonate

A weak acid (or base) is one that ionizes to a VERY small extent (< 5%).

MAR

## Equilibria Involving Weak Acids and Bases

Consider acetic acid,  $CH_3CO_2H$  (HOAc)

$$K_a = \frac{[H_3O^+][OAc^-]}{[HOAc]} = 1.8 \times 10^{-5}$$

(K is designated  $K_a$  for ACID)

Because  $[H_3O^+]$  and  $[OAc^-]$  are SMALL,  $K_a \ll 1$ .

MAR

### Equilibrium Constants for Weak Acids (K<sub>a</sub>)

$$K_a = \frac{[\text{H}_3\text{O}^+][\text{A}^-]}{[\text{HA}]}$$

Weak acids have K<sub>a</sub> < 1  
Leads to small [H<sub>3</sub>O<sup>+</sup>] and a pH of 2 - 7

MAR

### Equilibrium Constants for Weak Bases (K<sub>b</sub>)

$$K_b = \frac{[\text{BH}^+][\text{OH}^-]}{[\text{B}]}$$

Weak bases have K<sub>b</sub> < 1  
Leads to small [OH<sup>-</sup>] and a pH of 12 - 7

MAR

### Equilibrium Constants for Weak Acids and Bases

Important relations: K<sub>a</sub>\*K<sub>b</sub> = K<sub>w</sub> and  
pK<sub>a</sub> + pK<sub>b</sub> = 14

MAR

### Ionization Constants for Acids/Bases

Acid Name	Acid	K <sub>a</sub>	Base	K <sub>b</sub>	Base Name
Perchloric acid	HClO <sub>4</sub>	large	ClO <sub>4</sub> <sup>-</sup>	very small	perchlorate ion
Sulfuric acid	H <sub>2</sub> SO <sub>4</sub>	large	HSO <sub>4</sub> <sup>-</sup>	very small	hydrogen sulfate ion
Hydrofluoric acid	HF	large	F <sup>-</sup>	very small	fluoride ion
Nitric acid	HNO <sub>3</sub>	large	NO <sub>3</sub> <sup>-</sup>	very small	nitrate ion
Hydrochloric acid	HCl	large	Cl <sup>-</sup>	very small	chloride ion
Hydrobromic acid	HBr	large	Br <sup>-</sup>	very small	bromide ion
Iodic acid	HOIO <sub>3</sub>	1.0	IO <sub>3</sub> <sup>-</sup>	1.0 × 10 <sup>-14</sup>	iodate ion
Sulfurous acid	H <sub>2</sub> SO <sub>3</sub>	1.2 × 10 <sup>-2</sup>	HSO <sub>3</sub> <sup>-</sup>	8.3 × 10 <sup>-13</sup>	hydrogen sulfite ion
Hydrogen sulfite ion	HSO <sub>3</sub> <sup>-</sup>	1.2 × 10 <sup>-7</sup>	SO <sub>3</sub> <sup>2-</sup>	8.3 × 10 <sup>-8</sup>	sulfite ion
Phosphoric acid	H <sub>3</sub> PO <sub>4</sub>	7.5 × 10 <sup>-3</sup>	H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	1.3 × 10 <sup>-12</sup>	dihydrogen phosphate ion
Hydrogen phosphate ion	H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	6.3 × 10 <sup>-8</sup>	HPO <sub>4</sub> <sup>2-</sup>	1.6 × 10 <sup>-7</sup>	hydrogen phosphate ion
Hydrofluoric acid	HF	7.2 × 10 <sup>-4</sup>	F <sup>-</sup>	1.4 × 10 <sup>-11</sup>	fluoride ion
Nitrous acid	HNO <sub>2</sub>	4.5 × 10 <sup>-4</sup>	NO <sub>2</sub> <sup>-</sup>	2.2 × 10 <sup>-11</sup>	nitrite ion
Formic acid	HCO <sub>2</sub> H	1.8 × 10 <sup>-4</sup>	HCO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-11</sup>	formate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Propionic acid	CH <sub>3</sub> CH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-5</sup>	CH <sub>3</sub> CH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-10</sup>	propionate ion
Hexafluoroantimonate ion	HF <sub>6</sub> SO <sub>3</sub> <sup>-</sup>	1.0 × 10 <sup>-5</sup>	HSO <sub>3</sub> <sup>-</sup>	1.0 × 10 <sup>-9</sup>	hexafluoroantimonate ion
Carbonic acid	H <sub>2</sub> CO <sub>3</sub>	4.2 × 10 <sup>-7</sup>	HCO <sub>3</sub> <sup>-</sup>	2.4 × 10 <sup>-8</sup>	hydrogen carbonate ion
Hydrogen carbonate ion	HCO <sub>3</sub> <sup>-</sup>	4.8 × 10 <sup>-11</sup>	CO <sub>3</sub> <sup>2-</sup>	2.1 × 10 <sup>-4</sup>	carbonate ion
Hydrogen sulfide	H <sub>2</sub> S	1 × 10 <sup>-7</sup>	HS <sup>-</sup>	1 × 10 <sup>-14</sup>	hydrogen sulfide ion
Dihydrogen phosphate ion	H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	6.2 × 10 <sup>-8</sup>	HPO <sub>4</sub> <sup>2-</sup>	1.6 × 10 <sup>-7</sup>	dihydrogen phosphate ion
Hydrogen sulfate ion	HSO <sub>4</sub> <sup>-</sup>	1.2 × 10 <sup>-2</sup>	SO <sub>4</sub> <sup>2-</sup>	8.3 × 10 <sup>-3</sup>	hydrogen sulfate ion
Hydrogen selenate ion	HSeO <sub>4</sub> <sup>-</sup>	1.3 × 10 <sup>-2</sup>	SeO <sub>4</sub> <sup>2-</sup>	7.7 × 10 <sup>-3</sup>	hydrogen selenate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion
Hydroxyacetic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Hexafluoroantimonate(II) ion	HF <sub>6</sub> SO <sub>2</sub> <sup>-</sup>	1.5 × 10 <sup>-4</sup>	HSO <sub>2</sub> <sup>-</sup>	6.7 × 10 <sup>-11</sup>	hexafluoroantimonate(II) ion
Hexafluoroantimonate(III) ion	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	1.3 × 10 <sup>-4</sup>	CF <sub>3</sub> SO <sub>3</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hexafluoroantimonate(III) ion
Formic acid	HOCH <sub>2</sub> CO <sub>2</sub> H	1.3 × 10 <sup>-4</sup>	HOCH <sub>2</sub> CO <sub>2</sub> <sup>-</sup>	7.7 × 10 <sup>-11</sup>	hydroxymethyl formate ion
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>	acetate ion
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>	benzoate ion

## K and Acid-Base Reactions

Acetic acid is only 0.42% ionized when  $[\text{HOAc}] = 1.0 \text{ M}$ . It is a **WEAK ACID**

Because  $[\text{H}_3\text{O}^+]$  is small, this must mean

- $\text{H}_3\text{O}^+$  is a stronger acid than HOAc
- $\text{OAc}^-$  is a stronger base than  $\text{H}_2\text{O}$
- K for this reaction is small

MAR

## Types of Acid/Base Reactions

### 1. Strong acid + Strong base (SA + SB) reactions:

*Net ionic equation:*

$$K = 1/K_w = 1 \times 10^{14} \quad \text{very product favored } K!$$

Mixing equal molar quantities of a strong acid and strong base produces a **neutral** solution.

*should write:*

MAR

## Types of Acid/Base Reactions

### 2. Weak acid + Strong base (WA + SB) reactions:

This is the reverse of the reaction of  $\text{CH}_3\text{CO}_2^-$  (conjugate base) with  $\text{H}_2\text{O}$ .

$\text{OH}^-$  stronger base than  $\text{CH}_3\text{CO}_2^-$

$$K = 1/K_b = 1.8 \times 10^9 \quad \text{very product favored } K!$$

Mixing equal molar quantities of a weak acid and strong base produces the acid's conjugate base. The solution is **basic**.

MAR

## Types of Acid/Base Reactions

### 3. Weak base + Strong acid (WB + SA) reactions:

This is the reverse of the reaction of  $\text{NH}_4^+$  (conjugate acid of  $\text{NH}_3$ ) with  $\text{H}_2\text{O}$ .

$\text{H}_3\text{O}^+$  stronger acid than  $\text{NH}_4^+$

$$K = 1/K_a = 1.8 \times 10^9 \quad \text{very product favored } K!$$

Mixing equal molar quantities of a strong acid and weak base produces the base's conjugate acid. The solution is **acidic**.

MAR

## Types of Acid/Base Reactions

### 4. Weak acid + weak base (WA + WB) reactions:

Product cation = conjugate acid of weak base.  
Product anion = conjugate base of weak acid.  
pH of solution depends on **relative strengths** of cation and anion (larger K  $\rightarrow$  smaller K).

MAR

*We will not be studying WA + WB reactions in CH 223*

MAR

## Types of Acid/Base Reactions: Summary

### Characteristics of Acid-Base Reactions

Type	Example	Net Ionic Equation	Species Present After Equal Molar Amounts Are Mixed; pH
Strong acid + strong base	$\text{HCl} + \text{NaOH}$	$\text{H}_3\text{O}^+(\text{aq}) + \text{OH}^-(\text{aq}) \rightleftharpoons 2 \text{H}_2\text{O}(\text{l})$	$\text{Cl}^-$ , $\text{Na}^+$ , pH = 7
Strong acid + weak base	$\text{HCl} + \text{NH}_3$	$\text{H}_3\text{O}^+(\text{aq}) + \text{NH}_3(\text{aq}) \rightleftharpoons \text{NH}_4^+(\text{aq}) + \text{H}_2\text{O}(\text{l})$	$\text{Cl}^-$ , $\text{NH}_4^+$ , pH < 7
Weak acid + strong base	$\text{HCO}_2\text{H} + \text{NaOH}$	$\text{HCO}_2\text{H}(\text{aq}) + \text{OH}^-(\text{aq}) \rightleftharpoons \text{HCO}_2^-(\text{aq}) + \text{H}_2\text{O}(\text{l})$	$\text{HCO}_2^-$ , $\text{Na}^+$ , pH > 7
Weak acid + weak base	$\text{HCO}_2\text{H} + \text{NH}_3$	$\text{HCO}_2\text{H}(\text{aq}) + \text{NH}_3(\text{aq}) \rightleftharpoons \text{HCO}_2^-(\text{aq}) + \text{NH}_4^+(\text{aq})$	$\text{HCO}_2^-$ , $\text{NH}_4^+$ , pH dependent on $K_a$ and $K_b$ of conjugate acid and base.

## Equilibria Involving A Weak Acid

Determining the pH of an acetic acid solution

MAR

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of HOAc,  $H_3O^+$ ,  $OAc^-$ , and the pH.

Step 1. Define ICE equilibrium using  $K_a$ .

initial

change

equilib

Note that we neglect  $[H_3O^+]$  from  $H_2O$ .  
HOAc = acetic acid,  $OAc^-$  = acetate ion

MAR

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of HOAc,  $H_3O^+$ ,  $OAc^-$ , and the pH.

Step 2. Write  $K_a$  expression

$$K_a = 1.8 \times 10^{-5} = \frac{[H_3O^+][OAc^-]}{[HOAc]} = \frac{x^2}{1.00 - x}$$

This is a quadratic equation; solve using the quadratic formula.

MAR

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of HOAc,  $H_3O^+$ ,  $OAc^-$ , and the pH.

Step 3. Solve  $K_a$  expression

$$K_a = 1.8 \times 10^{-5} = \frac{[H_3O^+][OAc^-]}{[HOAc]} = \frac{x^2}{1.00 - x}$$

First assume x is **very small** because  $K_a$  is so small. If so:

$$K_a = 1.8 \times 10^{-5} = \frac{x^2}{1.00}$$

Therefore,

$$x = [H_3O^+] = [OAc^-] = [1.8 \times 10^{-5} \cdot 1.00]^{1/2} = [K_a \cdot C_a]^{1/2}$$

$C_a$  = concentration (M) of acid

MAR

## Equilibria Involving A Weak Acid

You have 1.00 M HOAc. Calc. the equilibrium concs. of HOAc,  $H_3O^+$ ,  $OAc^-$ , and the pH.

Step 3. Solve  $K_a$  **approximate** expression:

$$K_a = 1.8 \times 10^{-5} = \frac{x^2}{1.00}$$

$$x = [H_3O^+] = [OAc^-] = [1.8 \times 10^{-5} \cdot 1.00]^{1/2}$$

$$x = [H_3O^+] = [OAc^-] = 4.2 \times 10^{-3} \text{ M}$$

$$\text{pH} = -\log [H_3O^+] = -\log (4.2 \times 10^{-3}) = 2.37$$

MAR

Exact solution with quadratic:  $x = 0.0042$ ,  $x = -0.0043$

MAR

## Equilibria Involving A Weak Acid

Consider the approximate expression:

$$K_a = 1.8 \times 10^{-5} = \frac{x^2}{1.00} \quad x = [H_3O^+] = [K_a \cdot 1.00]^{1/2}$$

For many weak acids

$$[H_3O^+] = [\text{conj. base}] = [K_a \cdot C_a]^{1/2}$$

where  $C_a$  = initial conc. of acid

Useful Rule of Thumb:

$$\text{If } 100 \cdot K_a < C_a, \text{ then } [H_3O^+] = [K_a \cdot C_a]^{1/2}$$

$$\text{or } \text{pH} = -\log [K_a \cdot C_a]^{1/2}$$

**Equilibria Involving A Weak Acid**

Calculate the pH of a 0.0010 M solution of formic acid,  $\text{HCO}_2\text{H}$ .

Approximate solution

$$[\text{H}_3\text{O}^+] = [K_a \cdot C_a]^{1/2} = 4.2 \times 10^{-4} \text{ M}, \text{ pH} = 3.37$$

Exact Solution

$$[\text{H}_3\text{O}^+] = [\text{HCO}_2^-] = 3.4 \times 10^{-4} \text{ M}$$

$$[\text{HCO}_2\text{H}] = 0.0010 - 3.4 \times 10^{-4} = 0.0007 \text{ M}$$

$$\text{pH} = 3.47$$

**100 \*  $K_a$  is not less than  $C_a$ !**

MAR

**Weak Bases**

MAR

**Equilibria Involving A Weak Base**

You have 0.010 M  $\text{NH}_3$ . Calculate the pH.

Step 1. Define equilibrium concs.

	$[\text{NH}_3]$	$[\text{NH}_4^+]$	$[\text{OH}^-]$
initial			
change			
equilib			

MAR

**Equilibria Involving A Weak Base**

You have 0.010 M  $\text{NH}_3$ . Calculate the pH.

Step 2. Solve the equilibrium expression

$$K_b = 1.8 \times 10^{-5} = \frac{[\text{NH}_4^+][\text{OH}^-]}{[\text{NH}_3]} = \frac{x^2}{0.010 - x}$$

Assume x is small ( $100 \cdot K_b < C_b$ ), so

$$x = [\text{OH}^-] = [\text{NH}_4^+] = [K_b \cdot C_b]^{1/2} = 4.2 \times 10^{-4} \text{ M}$$

$$\text{check: } [\text{NH}_3] = 0.010 - 4.2 \times 10^{-4} \approx 0.010 \text{ M}$$

**Valid approximation!**

Exact solution with quadratic:  $x = 0.00042$ ,  $x = -0.00043$

MAR

**Equilibria Involving A Weak Base**

You have 0.010 M  $\text{NH}_3$ . Calculate the pH.

Step 3. Calculate pH

$$[\text{OH}^-] = 4.2 \times 10^{-4} \text{ M}$$

$$\text{so pOH} = -\log [\text{OH}^-] = 3.37$$

$$\text{Because pH} + \text{pOH} = 14,$$

$$\text{pH} = 10.63$$

$$\text{or pH} = 14 + \log [K_b \cdot C_b]^{1/2} = 10.63$$

MAR

**Overview: Calculating pH of Acids & Bases**

**Strong acid:**  $\text{pH} = -\log C_a = -\log [\text{H}_3\text{O}^+]$

**Strong base:**

$$\text{pH} = 14 + \log C_b = 14 + \log [\text{OH}^-]$$

**Weak acid:**

$$\text{pH} = -\log [K_a \cdot C_a]^{1/2} \quad (100 \cdot K_a < C_a)$$

**Weak base:**

$$\text{pH} = 14 + \log [K_b \cdot C_b]^{1/2} \quad (100 \cdot K_b < C_b)$$

**Memorize!**

MAR

## Acid-Base Properties of Salts

$MX + H_2O \rightarrow$  acidic or basic solution?

Consider  $NH_4Cl$

(a) Reaction of  $Cl^-$  with  $H_2O$

$Cl^-$  ion is a VERY weak base because its conjugate acid is strong.

Therefore,  $Cl^- \rightarrow$  neutral solution

MAR

## Acid-Base Properties of Salts

$MX + H_2O \rightarrow$  acidic or basic solution?

(b) Reaction of  $NH_4^+$  with  $H_2O$

$NH_4^+$  ion is a moderate acid ( $K_a = 5.6 \times 10^{-10}$ ) because its conjugate base is weak.

Therefore,  $NH_4^+ \rightarrow$  acidic solution

MAR

## Acid-Base Properties of Salts

Acid and Base Properties of Some Ions in Aqueous Solution

	Neutral	Basic	Acidic
Anions	$Cl^-$ $NO_3^-$ $Br^-$ $ClO_4^-$ $I^-$	$CH_3CO_2^-$ $CN^-$ $HCO_2^-$ $PO_4^{3-}$ $HPO_4^{2-}$ $CO_3^{2-}$ $HCO_3^-$ $SO_3^{2-}$ $S^{2-}$ $HS^-$ $OCl^-$ $F^-$ $NO_2^-$	$HSO_4^-$ $H_2PO_4^-$ $HSO_3^-$
Cations	$Li^+$ $Mg^{2+}$ $Na^+$ $Ca^{2+}$ $K^+$ $Ba^{2+}$	$Al(H_2O)_5(OH)^{2+}$ and analogous ions	$Al(H_2O)_6^{3+}$ and hydrated transition metal cations ( $Fe(H_2O)_6^{3+}$ ) $NH_4^+$

MAR

## Acid-Base Properties of Salts

Calculate the pH of a 0.10 M solution of  $Na_2CO_3$ .

$Na^+ + H_2O \rightarrow$  neutral

$$K_b = 2.1 \times 10^{-4}$$

Step 1. Set up ICE concentration table

initial  
change  
equilib

MAR

## Acid-Base Properties of Salts

Calculate the pH of a 0.10 M solution of  $Na_2CO_3$ .

$Na^+ + H_2O \rightarrow$  neutral

$$K_b = 2.1 \times 10^{-4}$$

Step 2. Solve the equilibrium expression

$$K_b = 2.1 \times 10^{-4} = \frac{[HCO_3^-][OH^-]}{[CO_3^{2-}]} = \frac{x^2}{0.10 - x}$$

Assume  $0.10 - x \approx 0.10$ , because  $100 \cdot K_b < C_b$

$$x = [HCO_3^-] = [OH^-] = [K_b \cdot C_b]^{1/2} = 0.0046 \text{ M}$$

Exact solution with quadratic:  $x = 0.0045$ ,  $x = -0.0047$

MAR

## Acid-Base Properties of Salts

Calculate the pH of a 0.10 M solution of  $Na_2CO_3$ .

$Na^+ + H_2O \rightarrow$  neutral

$$K_b = 2.1 \times 10^{-4}$$

Step 3. Calculate the pH

$$[OH^-] = 0.0046 \text{ M}$$

$$pOH = -\log [OH^-] = 2.34$$

$$pH + pOH = 14,$$

so **pH = 11.66**, and the solution is \_\_\_\_\_.

$$\text{or } pH = 14 + \log [K_b \cdot C_b]^{1/2} = 11.66$$

## Lewis Acids & Bases

Clifford and Aiden with red Nickel bis(dimethylglyoximate) solution (April 2023)

MAR

## Lewis Acids & Bases

Lewis acid = electron pair acceptor ( $\text{BF}_3$ )

Lewis base = electron pair donor ( $\text{NH}_3$ )

3.  $3.0 \times 10^{-10}$
4.  $2.1 \times 10^{-4}$
5. 0.0021 M,  $3.6 \times 10^{-4}$  ( $K_a = 3.0 \times 10^{-4}$  using short method)
6.  $[\text{H}_3\text{O}^+] = 8.1 \times 10^{-11} \text{ M}$ ,  $[\text{OH}^-] = 1.2 \times 10^{-4} \text{ M}$ ,  $K_b = 9.7 \times 10^{-7}$
7.  $\text{Fe}^{2+}(\text{aq})$  would be a Lewis acid,  $\text{CH}_3\text{NH}_2$  would be a Lewis base
